1 Introduction and document description rules

1.1 Introduction

This user manual provides application developers with all the information about how to use MCU (micro-controller) system architecture, memory and peripherals.

For information about Arm® Cortex®-M4F core, please refer to *Arm® Cortex® - M4 Technical Reference Manual*; please refer to the corresponding datasheet for detailed data such as model information, dimension and electrical characteristics of the device; for all MCU series models, please refer to the corresponding datasheet for memory mapping, peripheral existence and their number.

It is hereby declared that Geehy Semiconductor Co., Ltd., hereinafter refer to as "Geehy".

1.2 Document description rules

1.2.1 "Register functional description" rules

- (1) Control (CTRL) registers are all "set to 1 and cleared to 0 by software", unless otherwise specified.
- (2) The control registers are usually followed by verb abbreviations to make a distinction. The verbs can be: EN-Enable, CFG-Configure, D-Disable, SET-Setup and SEL-Select
- (3) The state register abbreviation is usually followed by FLG to make a difference.
- (4) The value and data registers usually include V, VALUE, D and DATA, which are not followed by verbs, such as: xxPSC and CNT.

1.2.2 Full name and abbreviation description of terms

Table 1 Abbreviation and Description of R/W Modes

R/W mode	Description	Abbreviation
read/write	Software can read and write this bit.	R/W
read-only	Software can only read this bit.	R
write-only	Software can only write this bit, and after reading this bit, the reset value will be returned.	W
read/clear	The software can read this bit and clear it by writing 1. Writing 0 has no effect on this bit.	RC_W1
read/clear	The software can read this bit and clear it by writing 0. Writing 1 has no effect on this bit.	RC_W0

R/W mode	Description	Abbreviation
read/clear by read	The software can read this bit and reading this bit will automatically clear it to 0, and writing this bit is invalid.	RC_R
read/set	The software can read and set this bit, and writing 0 has no effect on this bit.	R/S
read-only write trigger	The software can read this bit and writing 0 or 1 can trigger an event but has no effect on the value of this bit.	RT_W
toggle	The software can flip this bit only by writing 1 and writing 0 has no effect on this bit.	T

Advanced High-Performance Bus	AHB
Advanced Peripheral Bus	APB
Core Couple Memory	CCM

2.2 System architecture block diagram

Arm® Cortex®-M4F core in the product has FPU, while the FPU of other series of products (unless otherwise specified) is beyond the core.

The system mainly consists of eight master modules and seven slave modules.

The master modules are I-bus, D-bus and S-bus of Arm® Cortex®-M4F core with FPU, general-purpose DMA1, general-purpose DMA2, and DMA2 peripheral bus, Ethernet DMA bus and USB OTG HS DMA bus.

The slave modules are internal Flash I-bus, D-bus, main internal memory SRAM1, auxiliary internal memory SRAM2, AHB1 bus and AHB1/APB bridge connected peripherals, peripherals on AHB2 bus and EMMC.

The bus matrix provides a platform to support the master module to access the slave module. The matrix can realize concurrent access, and the CPU still has efficient processing capacity when multiple peripherals are running at high speed.

It also has a 64-bit core couple memory, and it can access only through CPU.

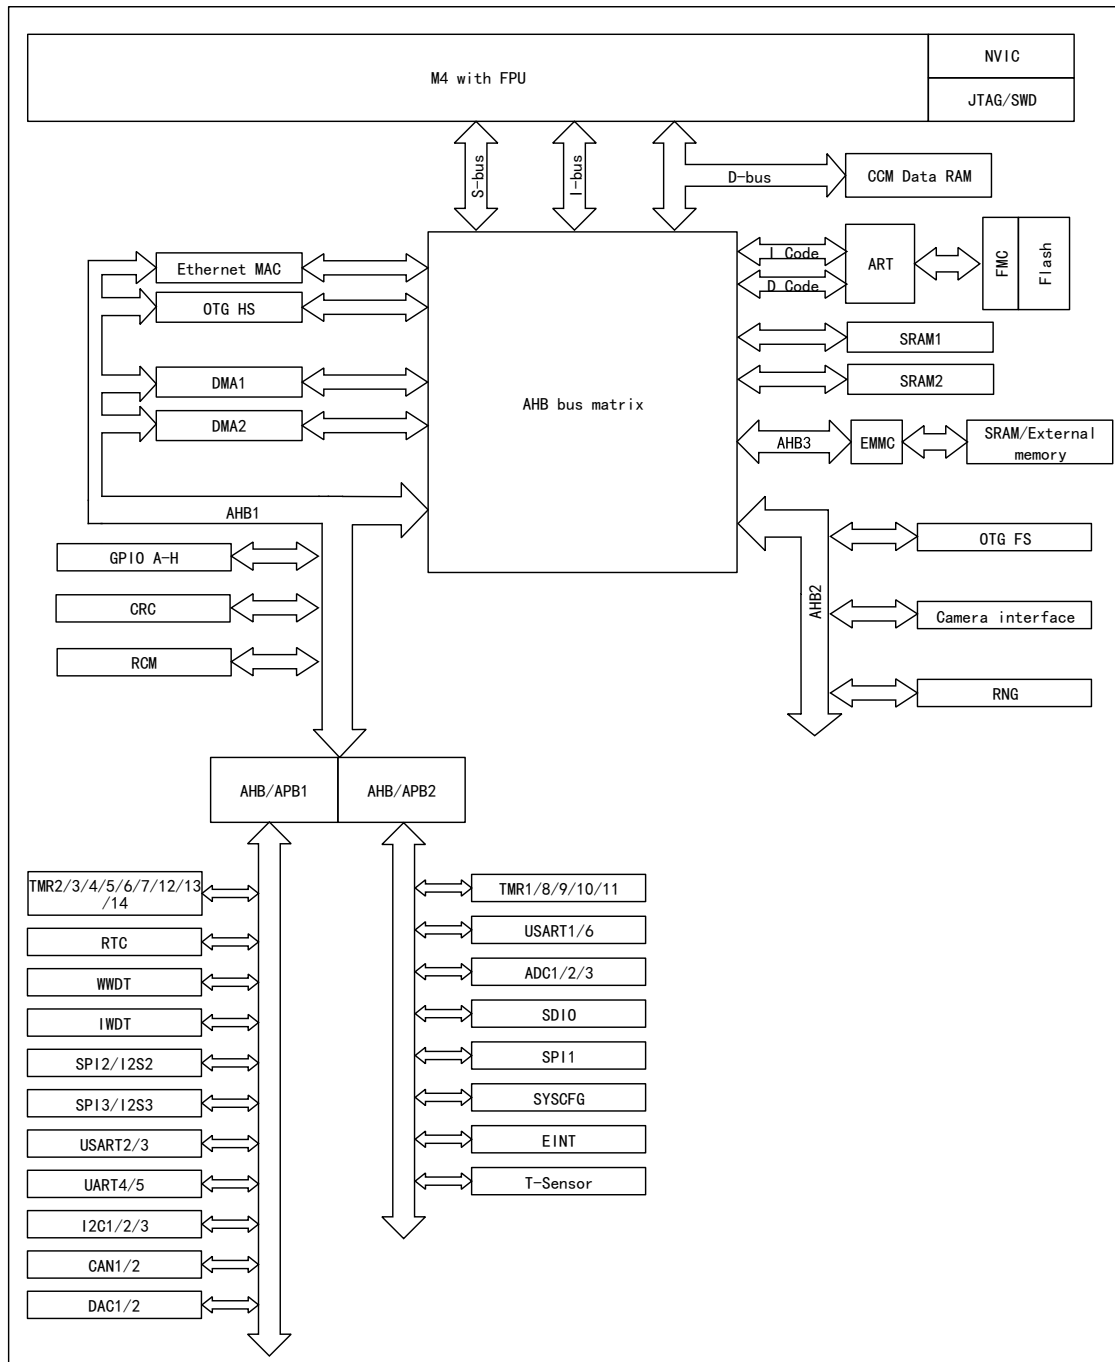

The name and description of the bus are shown in the following table.

Table 5 Bus Name

Name	Description
I-bus	Connect the instruction bus of Arm® Cortex® -M4F core and the bus matrix. Used for obtaining instructions.
D-bus	Connect the data bus of Arm® Cortex® -M4F core and the bus matrix. Used for text loading and debugging access.
S-bus	Connect the system bus of Arm® Cortex® -M4F core and the bus matrix. Used for accessing the data in peripherals and SRAM.
DMA memory bus	Connect the main interface of DMA memory and the bus matrix. Realize transmission related to the memory through DMA.

Name	Description
DMA peripheral bus	Connect the main interface of DMA peripherals and the bus matrix. It can not only realize access of DMA to the peripherals on AHB, but also realize transmission among memories.
Ethernet DMA bus	Connect the main interface of Ethernet DMA and the bus matrix. The data are loaded/stored in the memory through Ethernet DMA.
USB OTG HS DMA bus	Connect the main interface of USB OTG HS DMA and the bus matrix. The data are loaded/stored in the memory through USB OTG DMA.
Bus matrix	Coordinate the access among modules, and roll polling algorithm is used during arbitration.
AHB/APB bridge	The bridge provides synchronous connection between AHB and APB buses. The non-32-bit access to APB register will be converted into 32 bits automatically.

Figure 1 APM32A407xGT7 System Architecture Block Diagram

Note:

- (1) Actually, APM32A407xGT7 series has two USB OTG_HS, and they share the clock, reset, bus address, CPU interrupt, power supply, pins and other related resources. Only one of two USB OTG_HS can be used at the same time. Their difference is: one has on-chip UTMI USB PHY (there is internal PLL with 60MHz output), while the other does not have.
- (2) For product information of each model, refer to the datasheet.

2.3 Memory mapping

The assigned addresses of memory mapping include the core (including core peripherals), on-chip Flash (including main memory area, system memory area and option bytes), on-chip SRAM, and bus peripherals (including AHB and APB peripherals). Please refer to the data manual of the corresponding model for specific information of various addresses.

2.3.1 Embedded SRAM

The product has backup SRAM (4KB) and system SRAM (192KB). The system SRAM is divided into three parts: SRAM1 (112KB), SRAM2 (16KB) and CCM (64KB).

SRAM1 and SRAM2

The main SRAM1 and auxiliary SRAM2 can be accessed by byte, half word (16 bits) or full word (32 bits). The mapping address of SRAM1 and SRAM2 is 0x2000 0000, and the main module can be accessed by all AHB.

Core couple memory (CCM)

The mapping address of CCM (64KB) is 0x1000 0000, and it can only be accessed by CPU through D-bus.

2.3.2 Bit band

Arm® Cortex®-M4F memory is mapped with two bit-band areas, and it maps each word in the alias memory area to one bit in the bit-band memory. Write a word to the alias memory and there will be the same effect as the read-change-write operation on the target of the bit-band area. Both peripheral register and SRAM are mapped into a bit band area, and it is allowed to perform single bit-band write and read operations.

The following gives a mapping formula:

$$\text{bit_word_addr} = \text{bit_band_base} + (\text{byte_offset} \times 32) + (\text{bit_number} \times 4)$$

2.4 Startup configuration

APM32A4xx series MCU realizes a special mechanism. By configuring the BOOT[1:0] pin, there are three different startup modes, and the system can not only start from Flash memory or system memory, but also start from the built-in SRAM. The memory selected as the start zone is determined by the selected startup mode.

Table 6 Startup Mode Configuration and Access Mode

Startup mode configuration		Startup mode	Access mode
BOOT1 pin	BOOT0 pin		
X	0	Main flash memory (Flash)	The main flash memory is mapped to the boot space, but it can still be accessed at its original address, that is, the contents of the flash memory can be accessed in two address areas.
0	1	System memory	The system memory is mapped to the boot space (0x0000 0000), but it can still be accessed at its original address.
1	1	Built-in SRAM	SRAM can be accessed only at the starting address.

Note:

- (1) The boot space address is 0x0000 0000
- (2) The original address of Flash is 0x0800 0000
- (3) The original address of the system memory is 0x1FFF 0000
- (4) The starting address of SRAM is 0x2000 0000
- (5) The user can select the startup mode after reset by setting the state of BOOT[1:0] pin.
- (6) BOOT pin should keep the user's required startup configuration in standby mode. When exiting from the standby mode, the value of boot pin will be latched.
- (7) If you choose to start from built-in SRAM, you must use NVIC's exception table and offset register to remap the vector table to SRAM when writing the application code.

Physical remapping

After BOOT pin is selected, MMSEL bit of SYSCFG_MMSEL register can be modified through software program to configure some register to allow access from I-Code bus. See SYSCFG register for specific configuration.

Embedded BootLoader

The embedded BootLoader mode will be selected to reprogram Flash through which of the following serial port:

- USART1
- USART3
- CAN2
- USB OTG_FS slave mode

3 FLASH memory

3.1 Full name and abbreviation description of terms

Table 7 Full name and abbreviation description of terms

Full name in English	English abbreviation
Flash Memory Controller	FMC
One-time Programmable	OTP
Adaptive Real-time	ART

3.2 Introduction

This chapter mainly introduces the storage structure, read, erase, write, read/write protection, unlock/lock characteristics of Flash, and the involved register functional description.

3.3 Main characteristics

- (1) Flash memory structure
 - Contain main memory area and information block
 - The capacity of main memory area is up to 1MB
 - The information block is divided into system memory, OTP area and option byte three areas
 - The capacity of the system memory area is 30KB, for storing BootLoader program, 96-bit unique UID, and main memory area capacity information
 - The OTP area is 528Bytes, 512 OTP bytes are used for storing user data, and the remaining 16 bytes are used for locking the corresponding OTP data block
 - The capacity of the option byte area is 16Bytes
- (2) Functional Description
 - Operate the Flash:
 - Read
 - Sector/Mass Erase
 - Write
 - Read/Write protection
 - Operate the option byte:
 - Read
 - Erase
 - Write
 - Read/Write protection

3.4 Flash memory structure

Table 8 Flash Memory Structure

Block	Name	Address range	Size (byte)	Sector
Main memory block		0x0800 0000–0x0800 3FFF	16K	Sector 0
		0x0800 4000–0x0800 7FFF	16K	Sector 1
		0x0800 8000–0x0800 BFFF	16K	Sector 2
		0x0800 C000–0x0800 FFFF	16K	Sector 3
		0x0801 0000 – 0x0801 FFFF	64K	Sector 4
		0x0802 0000 – 0x0803 FFFF	128K	Sector 5
	
		0x080E 0000–0x080F FFFF	128K	Sector 11
Information block	System memory	0x1FFF 0000–0x1FFF 77FF	30K	-
	OTP area	0x1FFF 7800–0x1FFF 7A0F	528	-
	Option byte	0x1FFF C000–0x1FFF C00F	16	-

3.5 Flash memroy functional description

3.5.1 Read Flash

Flash has a prefetch buffer area, and it can be turned on only when the power supply voltage is not lower than 2.1V.

The reading speed of Flash is affected by the number of wait cycles, and the number of wait cycles is affected by HCLK and power supply voltage. Assuming the wait cycle is n, and the rising base of HCLK range is X

- When (n+1) X is less than the maximum value:
 $nX < HCLK \leq (n+1) X$
- When (n-1) X is greater than the maximum value:
 $nX < HCLK \leq \text{maximum value}$

Table 9 X Affected by Voltage Range and Maximum Value of HCLK

Voltage range	1.8V-2.1V	2.1V-2.4V	2.4V-2.7V	2.7V-3.6V
X	20MHz	22MHz	24MHz	30MHz
Maximum value	160MHz	168MHz	168MHz	168MHz

Note:

When PMU_CTRL register VOSSEL=0, the maximum value of HCLK is 144MHz; when VOSSEL=1, the maximum value of HCLK is 168MHz.

CPU frequency can be adjusted by selecting different wait cycles, so as to

adjust the reading speed of Flash.

3.5.1.1 Adaptive real-time memory accelerator (ART)

ART accelerator can improve the execution speed of Flash, so that the Flash can execute programs with fewer wait cycles at high CPU frequency.

Prefetch buffer area

When needing to insert wait cycle to access Flash, the next instruction line of Flash can be pre-read through I-Code bus, to improve the access rate.

I-cache

I-cache is an instruction buffer memory. The instructions in I-cache can be obtained without delay. The system can store 64 lines of 128-bit instructions in I-cache and the I-cache function can be enabled through ICACHEEN bit of FMC_ACCTRL register.

D-cache

D-cache is a data buffer memory. The system accesses the data buffer area of Flash through D-Bus to reduce the waiting time. Access of D-bus is prior to I-bus. The system can store 8 lines of 128-bit instructions in D-cache and the D-cache function can be enabled through DCACHEEN bit of FMC_ACCTRL register.

3.5.2 Main memory block

When erasing/writing to the main memory, Flash can no longer be read.

Number of parallel bits

The number of parallel bits is the number of bytes to be processed when erasing/writing to the Flash, and it is determined by the power supply voltage and the use of external power supply. The number of parallel bits is configured by programming the PGSIZE bit of FMC_CTRL register. The determinant factors and the number of parallel bits are shown in the table below:

Table 10 Relationship between Determinant Factors and Number of Parallel Bits

Voltage range (V)	1.8-2.1	2.1-2.4	2.4-2.7	2.7-3.6	2.7-3.6 (external VPP is used)
Number of parallel bits	8-bit	16-bit		32-bit	64-bit

3.5.2.1 Erase main memory block

Flash can support sector erase and mass erase (erase all). Mass erase does not affect OTP sector or configuration sector.

Main memory page erase

Page erase is an independent erase according to the main memory area page selected by the program, which will not have any impact on the page not selected for erasure.

After the correct page erase (or flash write operation) is completed, OPRCMP bit of FMC_STS register will be set. If OPCINTEN interrupt is enabled, an operation completion interrupt will be triggered. Users need to note that the page to be erased must be a valid page (the valid address of the main memory area and the address not protected by write).

Main memory mass erase

The mass erase operation will erase all the contents in the main storage area of Flash, so the users need to pay special attention when using it to avoid the loss of important data caused by misoperation.

Mass erase does not affect OTP sector or configuration sector.

3.5.2.2 Write main memory block

Flash supports byte, half-word, word, and double-word write operation, specifically depending on the number of parallel bits.

It's important to check whether the destination address has been erased before writing to ensure correct writing. Flash unit must be erased into 1 before writing.

If the destination address has write protection, the written data is invalid and a write protection error will be triggered (WPROTERR bit of FMC_STS register is set to "1").

In FMC_STS register, there are three write error bits, which are PGALGERR (programming alignment error), PGPRLEERR (programming parallelism error) and PGSEQERR (programming sequence error).

Programming alignment error

To program more than 128-bit lines of data to the Flash, a programming alignment error will occur, and the PGALGERR bit will be set to 1.

Programming parallelism error

If the width of the write operation is inconsistent with the number of parallel bits, the write operation will be suspended, a programming parallelism error will be generated, and the PGPRLEERR bit will be set to 1.

Programming sequence error

The correct programming sequence is:

- (1) Confirm the operation currently not performed to the Flash through FMC_STS[BUSY]
- (2) Set FMC_CTRL[PG] to 1
- (3) Conduct write operation
- (4) Operation is completed, waiting for BUSY bit to be cleared to zero

If the programming sequence is wrong, a programming sequence error will occur, and the PGSEQERR bit will be set to 1.

3.5.2.3 Lock/unlock

FMC_CTRL[LOCK] can only be set to 1, so as to lock Flash control register, and the main memory block area can not be programmed.

Write the keywords 0x4567 0123 and 0xCDEF 89AB to the FMC_KEY register, and when the system detects unlocking sequence, it will clear the LOCK bit of FMC_CTRL register to zero, Flash control register and the main memory block will be unlocked.

3.5.2.4 Buffer

If the write operation of Flash involves some data in D-cache, the data in Flash and D-cache will be modified.

If the erase operation of Flash involves the data in D-cache or I-cache, the data shall be written to the cache before it.

3.5.2.5 Interrupt

An interrupt will occur in case of any of the following events:

- End of operation: End of erase/write operation
- Write protection error: Perform erase/write operation for the write protection area
- Programming error: An error occurs during erase/write/read

When OPCINTEN bit or ERRINTEN bit in FMC_CTRL register is set to 1 and the corresponding interrupt event occurs, an interrupt will be generated.

3.5.3 Option byte

The address and composition of the option byte are shown in the following table, and the specific meaning description can be seen in the corresponding bit of FMC_OPTCTRL register.

Table 11 Instructions for Option Bytes

Address	Bit field	Option byte	Functional description
0x1FFF C000	1:0	-	-

Address	Bit field	Option byte	Functional description
	3:2	BORLVL	Brownout reset level
	4	-	-
	5	WDTSEL	Select the watchdog
	6	RSTSTOP	Reset occurs when entering the stop mode
	7	RSTSTDB	Reset occurs when entering the standby mode
	15:8	RPROT	Read protection
0x1FFF C008	11:0	NWPROT	No write protection
	15:12	-	-

3.5.3.1 Erase/write option byte

The option byte must be unlocked before erasing/writing.

The programming sequence of option byte is:

- (1) Confirm the operation currently not performed to the Flash through FMC_STS[BUSY]
- (2) Write the programming value to FMC_OPTCTRL
- (3) Set FMC_OPTCTRL[OPTSTART] to 1
- (4) Operation is completed, waiting for BUSY bit to be cleared to zero

Note:

If the page erase/write operation of the main memory block is performed immediately after the option byte write operation is completed, the following steps must be performed after the option byte write operation is completed:

- ① Unlock the main memory block
- ② Write 0x08 in the address: 0x40023C30
- ③ Lock the main memory block

After the above three steps are performed, the page erase/write operation of the main memory block could be performed.

3.5.3.2 Lock/unlock

FMC_OPTCTRL[OPTLOCK] can only be set to 1, so as to lock the option byte area.

Write the keywords 0x0819 2A3B and 0x4C5D 6E7F to the FMC_OPTKEY

register, and when the system detects unlocking sequence, it will clear the OPTLOCK bit of FMC_OPTCTRL register to zero and the option byte will be unlocked.

3.5.4 Write protection

In order to prevent accidental rewriting of Flash due to program disorder, in default state, the Flash supports write protection function of up to 12 user sectors; when the corresponding bit of the FMC_OPTCTRL[NWPROT] bit field is at low level, the corresponding sector will be write-protected, and the sector cannot be erased/written.

3.5.4.1 Write protection error

FMC_STS[WPROTERR] is a write protection error bit, and it will be set to 1 when any of the following events occurs:

- Perform erase/write operation for the write protection area
- Execute page erase/mass erase for invalid sector
- Meanwhile, select page erase and mass erase
- Flash is under read protection but detects erase/write request
- Perform write operation for user configuration area
- Perform write operation for the locked OTP area

3.5.5 Read protection

In order to prevent untrusted code from reading Flash data, you can choose to use the read protection function for the Flash and the read protection level can be selected by configuring the value of the FMC_OPTCTRL[RPROT] bit field. The read protection has three levels, namely, Level 0, Level 1 and Level 2.

The access restriction at different read protection levels is shown in the following table.

Table 12 Restriction at Different Read Levels

Storage area	Level	Bootstrap from Flash			Debugging function, bootstrap from RAM or system memory		
		Read	Write	Erase	Read	Write	Erase
OTP	Level 1	✓		-	X		-
	Level 2						
Option byte	Level 1	✓					
	Level 2	X					
Flash and backup SRAM	Level 1	✓			X		X(1)
	Level 2				X		

Note:

(1) means that only when Level 1 changes to Level 0, can the data of Flash and backup SRAM be erased.

"√" means the operation is allowed, "X" means not allowed, and "-" means undefined.

3.5.5.1 Level 0

When FMC_OPTCTRL[RPROT]=0xAA, the read protection function is not used for Flash.

3.5.5.2 Level 1

When FMC_OPTCTRL[RPROT]=any value (except 0xAA and 0xCC), the read protection level is 1. At this time, if the level is adjusted to Level 0, mass erase operation will be performed to erase all data of Flash and backup SRAM. Mass erase only affects user code area, and write-protected other option bytes and OTP will not be affected.

3.5.5.3 Level 2

When FMC_OPTCTRL[RPROT]=0xCC, the read protection level is 2. Then:

- Reserve the read protection function of Level 1
- It is not allowed to bootstrap from RAM or system memory
- JTAG, SWV, ETM and boundary scan is disabled
- The option byte is locked

Note: When the read protection level is set to 2, it cannot be degraded any more.

3.5.6 OTP

The following table shows OTP structure.

Table 13 OTP Structure

Address	[31:0]	[63:32]	[95:64]	[127:96]	Block
0x1FFF 7800	OTP0	OTP0	OTP0	OTP0	Data block 0
0x1FFF 7810	OTP0	OTP0	OTP0	OTP0	
0x1FFF 7820	OTP1	OTP1	OTP1	OTP1	Data block 1
0x1FFF 7830	OTP1	OTP1	OTP1	OTP1	
0x1FFF 7840	OTP2	OTP2	OTP2	OTP2	Data block 2
0x1FFF 7850	OTP2	OTP2	OTP2	OTP2	
.....
0x1FFF 79E0	OTP15	OTP15	OTP15	OTP15	Data block 15
0x1FFF 79F0	OTP15	OTP15	OTP15	OTP15	

Address	[31:0]	[63:32]	[95:64]	[127:96]	Block
0x1FFF 7A00	LOCKB0 ...	LOCKB4 ...	LOCKB8 ...	LOCKB12 ...	Lock block
	LOCKB3	LOCKB7	LOCKB11	LOCKB15	

OTP consists of 16 32-byte data blocks and 1 16-byte lock block. The lock block n is used to lock the data block n (n=0...15), and the corresponding data block can be programmed only when the value of the lock block is 0x00. The value of the lock block can only be 0x00 or 0xFF; otherwise, the OTP byte cannot be used normally.

Note that neither data block nor lock block of OTP can be erased.

3.6 Register address mapping

Table 14 FMC Register Address Mapping

Register name	Description	Offset address
FMC_ACCTRL	Flash access control register	0x00
FMC_KEY	Flash key register	0x04
FMC_OPTKEY	Flash option key register	0x08
FMC_STS	Flash state register	0x0C
FMC_CTRL	Flash control register	0x10
FMC_OPTCTRL	Flash option control register	0x14

3.7 Register functional description

3.7.1 Flash access control register (FMC_ACCTRL)

Offset address: 0x00

Reset value: 0x0000 0000

Field	Name	R/W	Description
2:0	WAITP	R/W	Wait Period This bit means the number of wait cycles. 000: 0 001: 1 010: 2 011: 3 100: 4 101: 5 110: 6 111: 7
7:3	Reserved		

Field	Name	R/W	Description
8	PREFEN	R/W	Prefetch Enable 0: Disable 1: Enable
9	ICACHEEN	R/W	Instruction Cache Enable 0: Disable 1: Enable
10	DCACHEEN	R/W	Data Cache Enable 0: Disable 1: Enable
11	ICACHERST	W	Instruction Cache Reset 0: Invalid 1: Reset
12	DCACHERST	R/W	Data Cache Reset 0: Invalid 1: Reset
31:13	Reserved		

3.7.2 Flash key register (FMC_KEY)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	KEY	W	Key When unlocking, this key needs to be written into this register.

3.7.3 Flash option key register (FMC_OPTKEY)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	OPTKEY	W	Option Key When unlocking, this key needs to be written into this register.

3.7.4 Flash state register (FMC_STS)

Offset address: 0x0C

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	OPRCMP	RC_W1	Operation Complete This bit will be set to 1 when the operation for Flash is completed.
1	OPRERR	RC_W1	Operation Error This bit will be set to 1 when an error occurs in operation process.
3:2	Reserved		

Field	Name	R/W	Description
4	WPROTERR	RC_W1	Write Protection Error This bit will be set to 1 when erase/write operation is performed for Flash write protection area.
5	PGALGERR	RC_W1	Programming Alignment Error This bit will be set to 1 when a programming alignment error occurs.
6	PGPRLERR	RC_W1	Programming Parallelism Error This bit will be set to 1 when a programming parallelism error occurs.
7	PGSEQERR	RC_W1	Programming Sequence Error This bit will be set to 1 when a programming sequence error occurs.
15:8	Reserved		
16	BUSY	R	Busy This bit will be set to 1 when operation is performed for Flash.
31:17	Reserved		

3.7.5 Flash control register (FMC_CTRL)

Offset address: 0x10

Reset value: 0x8000 0000

This register can be accessed only when there is no Flash operation ongoing.

Field	Name	R/W	Description
0	PG	R/W	Programming When this bit is set to 1, Flash programming can be enabled.
1	SERS	R/W	Sector Erase When this bit is set to 1, sector erase can be enabled.
2	MERS	R/W	Mass Erase When this bit is set to 1, mass erase can be enabled.
6:3	SNUM	R/W	Sector Number This bit field is used for the specified erase sector. 0000: Sector 0 0001: Sector 1 0010: Sector 2 1011: Sector 11 Others: Reserved
7	Reserved		
9:8	PGSIZE	R/W	Program Size This bit field is used to select the number of parallel bits. 00: 8-bit 01: 16-bit 10: 32-bit 11: 64-bit
15:10	Reserved		

Field	Name	R/W	Description
16	START	R/S	Start When this bit is set to 1, the erase operation can be started. This bit will be cleared to zero when BUSY bit is cleared to zero.
23:17	Reserved		
24	OPCINTEN	R/W	Operation Complete Interrupt Enable 0: Disable 1: Enable
25	ERRINTEN	R/W	Error interrupt Enable 0: Disable 1: Enable
30:26	Reserved		
31	LOCK	R/S	Lock When this bit is set to 1, it means that this register is locked; when the unlocking sequence is detected, it will be cleared to zero by the hardware.

3.7.6 Flash option control register (FMC_OPTCTRL)

Offset address: 0x14

Reset value: 0x0FFF AAED

This register can be accessed only when there is no Flash operation ongoing.

Field	Name	R/W	Description
0	OPTLOCK	R/S	Option Lock When this bit is set to 1, it means that this register is locked; when the unlocking sequence is detected, it will be cleared to zero by the hardware.
1	OPTSTART	R/S	Option Start After this bit is set to 1 by the software, the option byte can be operated and it can be cleared to zero when the BUSY bit is set to zero.
3:2	BORLVL	R/W	Brownout Reset Level When the power supply voltage is less than the threshold of the brownout reset level, a reset will be generated. 00: Level 3, voltage range: 2.7V-3.6V 01: Level 2, voltage range: 2.4V-2.7V 10: Level 1, voltage range: 2.1V-2.4V 11: Disable, voltage range: 1.8V-2.1V
4	Reserved		
5	WDTSEL	R/W	Watchdog Select 0: Hardware watchdog 1: Software watchdog
6	RSTSTOP	R/W	nReset in STOP Mode 0: Reset occurs when entering the Stop mode 1: Reset does not occur when entering the Stop mode

Field	Name	R/W	Description
7	RSTSTDB	R/W	nReset in STANDBY Mode 0: Reset occurs when entering the Standby mode 1: Reset does not occur when entering the Standby mode
15:8	RPROT	R/W	Read Protect This bit field is used to select the erread protection level. 0xAA: Level 0 0xCC: Level 2 Others: Level 1
27:16	NWPROT	R/W	Not Write Protect 0: Write protection is enabled 1: Write protection is disabled
31:28	Reserved		

4 External Memory Controller (EMMC)

4.1 Full name and abbreviation description of terms

Table 15 Full name and abbreviation description of terms

Full name in English	English abbreviation
Static Random Access Memory	SRAM
Read Only Memory	ROM
Pseudo Static Random Access Memory	PSRAM
Random Access Memory	RAM
Synchronous Dynamic Random Access Memory	SDRAM
Multiplex	MUX
Width	WID
Flash Memory	FM
Access	ACC
Wait	W
Signal	S
Polarity	POL
Asynchronous	ASYN
Burst	BURST
Timing	TIM
Setup	SET
Hold	HLD
Empty	E

4.2 EMMC Overview

EMMC includes SMC (static memory controller). SMC is responsible for controlling SRAM, PSRAM, NandFlash, NorFlash and PCCard.

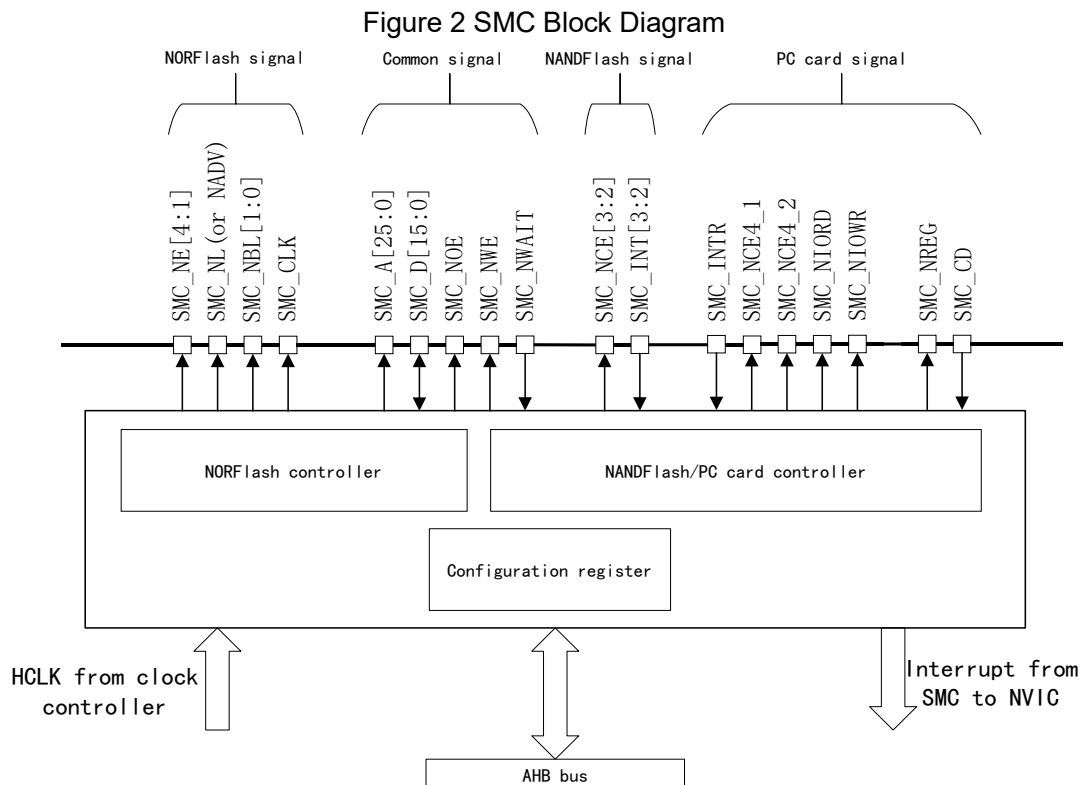

4.3 SMC Introduction

SMC is used to manage the extended static memory peripherals; AHB transmission signals can be converted to the appropriate external devices; there are four internal memory blocks, each of which controls different types of memory and is distinguished by chip selection signal; only one external device

can be accessed at any moment; each memory block can be configured separately, and the timing can be programmed for external devices.

4.4 SMC Structure Block Diagram

SMC consists of five parts: AHB bus interface, configuration register, NORFlash controller, NANDFlash/PC card controller and external device interface, specifically as shown in the figure below:

4.5 SMC Functional Description

4.5.1 SMC Access Rules

SMC is an interface for internal CPU to access external static memory through AHB bus. On AHB bus, the operation of 32-bit data will be converted into continuous 16 or 8-bit operation. In order to ensure the consistency of data transmission, SMC needs to comply with the following rules in external read-write operation:

- (1) When the width of AHB accessing external data is equal to that of memory data, the data can be transmitted normally without any problem.
- (2) When the width of AHB accessing external data is larger than that of memory data, the access operation will be automatically cut to be consistent with the width of external data for transmission.

- (3) When the width of AHB accessing external data is less than that of memory data, if the external memory has the function of byte selection, it can transmit data normally through byte channel; if it does not have such function, it does not allow write operation, and only allows read operation.

4.5.2 External device address mapping

SMC divides external devices into multiple memory blocks, and different memory blocks control different external devices. The specific classification is shown in the table below:

Table 16 External Device Address Mapping Table

Start address	End address	Memory block	Memory type supported
0x60000000	0x6FFFFFFF	Memory block 1 (4*64MB)	NOR/PSRAM
0x70000000	0x7FFFFFFF	Memory block 2 (4*64MB)	NAND
0x80000000	0x8FFFFFFF	Memory block 3 (4*64MB)	NAND
0x90000000	0x9FFFFFFF	Memory block 4 (4*64MB)	PC card

4.5.3 NOR flash memory and PSRAM

4.5.3.1 Address mapping

Memory block 1 is used to control NOR/PSRAM memory, which is divided into four 64MB areas of the same size. The selection of each area depends on the value of HADDR [27:26], and the specific information is as follows:

Table 17 Address Mapping of Memory Block 1

HADDR[27:26]	Start address	End address	Area block
00	0x60000000	0x63FFFFFF	Area block 1
01	0x64000000	0x67FFFFFF	Area block 2
10	0x68000000	0x6BFFFFFF	Area block 3
11	0x6C000000	0x6FFFFFFF	Area block 4

HADDR is the internal AHB address line that needs to be converted to the external memory. It is a byte address. However, some external memories are not accessed by byte, so the address may be inconsistent. In order to avoid the error caused by this situation, SMC will be adjusted according to the following rules:

- When the width of external memory data is 8 bits, HADDR[25:0] is connected to SMC_A [25:0], while SMC_A[25:0] is connected to the external memory address line.
- When the width of external memory data is 16 bits, HADDR[25:1] is connected to SMC_A [24:0], while SMC_A[24:0] is connected to the external memory address line.

4.5.3.2 Interface signal and controller

The memory block 1 supports NOR Flash, PSRAM, SRAM and ROM external memory. There are corresponding chip selection signals NE[x] (x=1..4) in the four areas of the memory block 1. All other signals are shared. The specific interface signals and functions are as follows:

Table 18 NOR Flash Interface Signal

SMC signal name	Signal direction	Function
CLK	Output	Synchronous clock signal
NE[x]	Output	Chip selection signal, x=1..4
NOE	Output	Read enable signal
NEW	Output	Write enable signal
NWAIT	Input	Signal that NOR flash memory requires SMC to wait
A[25:0]	Output	Non-multiplexing: A[25:0] all are address bus
	Output	Multiplexing: A[25:16] is address bus
AD[15:0]	Input/Output	Non-multiplexing: Bidirectional data bus
	Input/Output	Multiplexing: Bidirectional address/Data bus
NL (=NADV)	Output	Effective address signal

Table 19 PSRAM Interface Signal

SMC signal name	Signal direction	Function
CLK	Output	Synchronous clock signal
NE[x]	Output	Chip selection signal, x=1..4
NOE	Output	Read enable signal
NEW	Output	Write enable signal
NWAIT	Input	Signal that PSRAM requires SMC to wait
A[25:0]	Output	Address bus
D[15:0]	Input/Output	Bidirectional data bus
NL (=NADV)	Output	Effective address signal

SMC signal name	Signal direction	Function
NBL[1]	Output	High byte enable
NBL[0]	Output	Low byte enable

Note: The output signal of the controller changes at the rising edge of the internal clock; in the synchronous write mode, the output data changes at the falling edge of the memory clock.

NOR Flash/PSRAM controller provides programmable timing parameters for external memory, including the parameters in the following table:

Table 20 Programmable NOR/PSRAM Timing Parameters

Parameter	Function	Access mode	Unit	Minimum	Maximum
Data generation time	The number of clocks required to generate the first data in burst mode	Synchronous	Memory clock cycle (CLK)	2	17
Clock division factor	The ratio of memory access clock cycle (CLK) to AHB clock cycle	Synchronous	AHB clock cycle (HCLK)	2	16
Bus recovery time	Duration of Bus recovery phase	Asynchronous or synchronous read		1	16
Data setup time	Duration of data setup phase	Asynchronous		2	256
Address hold time	Duration of address hold phase	Synchronous, multiplexing IO		2	16
Address setup time	Duration of address setup phase	Asynchronous		1	16

4.5.4 NAND flash memory and PC card

4.5.4.1 Address mapping

Memory blocks 2, 3 and 4 are used to access NAND flash memory and PC card. Each memory block is also divided into different areas, the corresponding effect of different areas is different, and the specific distribution is as follows:

Table 21 Address Mapping of Memory Blocks 2 3 and 4

SMC memory block	Storage space	Start address	End address
Memory block 2-NAND flash memory	General	0x70000000	0x73FFFFFF
	Attributes	0x78000000	0x7BFFFFFF
	General	0x80000000	0x83FFFFFF

SMC memory block	Storage space	Start address	End address
Memory block 3-NAND flash memory	Attributes	0x88000000	0x8BFFFFFF
Memory block 4-PC card	General	0x90000000	0x93FFFFFF
	Attributes	0x98000000	0x9BFFFFFF
	I/O	0x9C000000	0x9FFFFFFF

NAND flash memory block is divided into three blocks in part of the low-byte area, and different blocks can be accessed through HADDR [17:16]. The specific division and selection of these three blocks are shown in the table below:

Table 22 NAND Memory Block Division

HADDR[17:16]	Address range	Block name
00	0x000000-0x00FFFF	Data block
01	0x010000-0x01FFFF	Command block
1X	0x020000-0x03FFFF	Address

In order to read and write NAND memory normally, the following steps are needed:

- Transmit command to the memory
- Transmit the address for reading and writing to the memory
- Read/Write data

The operation address of the corresponding three-step operation corresponds to the three blocks in the memory block. To transmit a command to the memory is to write the corresponding command value to the command block; to transmit an address to the memory is to transmit the corresponding address value to the address block; to read and write data is to read and write in the data block; finally write or read out the internal unit of NAND, and the address of the corresponding unit is the address written in the address block.

4.5.4.2 Interface signal and controller

NAND/PC card controller can control three memory blocks. The memory blocks 2 and 3 support NAND Flash, and the memory block 4 supports PC card devices. Three memory blocks have their own chip selection signals, and the specific interfaces and functions are as follows:

Table 23 NAND Flash Interface Signal

SMC signal name	Signal direction	Function
NCE[x]	Output	Chip selection signal, x=2, 3
NOE (=NRE)	Output	Read enable signal
NEW	Output	Write enable signal

SMC signal name	Signal direction	Function
NWAIT/INT[3:2]	Input	NAND Flash ready/busy input signal
A[17]	Output	NAND Flash address latch signal (ALE)
A[16]	Output	NAND Flash command latch signal (CLE)
D[15:0]	Input/Output	8-bit multiplexing: D[7:0] bidirectional address/data bus
	Input/Output	16-bit multiplexing: D[15:0] bidirectional address/data bus

Table 24 PC Card Interface Signal

SMC signal name	Signal direction	Function
NCE4_1	Output	Chip selection signal 1
NCE4_2	Output	Chip selection signal 2 (select 16-bit or 8-bit operation)
NOE	Output	Read enable signal
NEW	Output	Write enable signal
NWAIT	Input	PC card wait signal
INTR	Input	PC card interrupt signal
CD	Input	PC card detection signal
A[10:0]	Output	Address bus
NIOS16	Input	Data transmission width of 16-bit transmission I/O space (must be grounded)
NIORD	Output	I/O space output enable
NIOWR	Output	I/O space write enable
NREG	Output	Selection of common space or attribute space access
D[15:0]	Output/Input	Bidirectional data bus

NAND Flash/PC card controller provides programmable timing parameters for external memory, including the parameters in the following table:

Table 25 Programmable NAND/PC Card Timing Parameters

Parameter	Function	Operation mode	Unit	Minimum	Maximum
Memory data bus high-impedance time	The time of holding the data bus in high-impedance state after starting write operation	Write	AHB clock cycle (HCLK)	0	255

Parameter	Function	Operation mode	Unit	Minimum	Maximum
Memory hold time	The number of clocks holding the address after transmitting the command, also the hold time of data during write operation	Read/Write		1	254
Memory waiting time	Minimum transmitting duration			2	256
Memory setup time	The number of clocks that set up the address before issuing the command			1	255

4.6 SMC register address mapping

Table 26 SMC Register Address Mapping

Register name	Description	Offset address
SMC_CSCTRL1...4	SRAM/NOR flash memory chip selection control register 1...4	$8*(x-1), x=1...4$
SMC_CSTIM1...4	SRAM/NOR flash memory chip selection timing register 1...4	$0x04 + 8*(x-1), x=1...4$
SMC_WRTTIM1...4	SRAM/NOR flash memory write timing register 1...4	$0x104 + 8*(x-1), x=1...4$
SMC_CTRL2...4	PC card/NAND flash memory control register 2...4	$0x40 + 0x20 * (x-1), x=2...4$
SMC_STSINT2...4	FIFO state and interrupt register 2...4	$0x44 + 0x20 * (x-1), x=2...4$
SMC_CMSTIM2...4	General-purpose memory space timing register 2...4	$0x48 + 0x20 * (x-1), x=2...4$
SMC_AMSTIM2...4	Attribute memory space timing register 2...4	$0x4C + 0x20 * (x-1), x=2...4$
SMC_IOSTIM4	I/O space timing register 4	0XB0
SMC_ECCRS2/3	ECC result register 2/3	$0x54 + 0x20 * (x-1), x=2 \text{ or } 3$

4.7 SMC register functional description

4.7.1 NOR flash memory and PSRAM control register

4.7.1.1 SRAM/NOR flash memory chip selection control register 1...4 (SMC_CSCTRL1...4)

Offset address: $0x8*(x-1)$, $x=1...4$

Reset value: 0x0000 30DX

Field	Name	R/W	Description
0	MBKEN	R/W	Enable the Corresponding Memory Bank 0: Disable 1: Enable
1	ADMUXEN	R/W	Address/Data Multiplexing Enable This bit is effective only for NORFlash and PSRAM. 0: Disable 1: Address low 16-bit and data sharing data bus
3:2	MTYPECFG	R/W	Memory Type Configure 00: SRAM, ROM (default value of Bank2~Bank4 after reset) 01: PSRAM 10; NORFlash (default value after Bank1 reset) Others:Reserved
5:4	MDBWIDCFG	R/W	Memory Data Bus Width Configure 00: 8 bits 01: 16 bits Others reserved
6	NORFMACCEN	R/W	NORFlash Memory Access Enable 0: Disable 1: Enable
7	Reserved		
8	BURSTEN	R/W	Burst Mode Enable In synchronous mode, use the burst mode to access the memory. 0: Disable 1: Enable
9	WSPOLCFG	R/W	Wait Signal Polarity Configure This bit is effective only in burst mode. 0: Low effective 1: High effective
10	WRAPBEN	R/W	Wrapped Burst Mode Enable This bit is effective only in burst mode. 0: Disable 1: Enable
11	WTIMCFG	R/W	Wait Timing Configure This bit is used to configure whether the memory generates NWAIT signal in the period before the waiting state or during the waiting period; this bit is effective only in burst mode. 0: NWAIT signal is effective in the data period before waiting 1: NWAIT signal is effective in the waiting period
12	WREN	R/W	Write Memory Enable This bit is used to enable write operation of SMC for the memory. 0: Disable write; otherwise, an AHB error will be generated 1: Allow write
13	WAITEN	R/W	Wait Enable

Field	Name	R/W	Description
			This bit is used to enable NWAIT signal to insert the wait state; this bit is effective only in burst mode. 0: Disable 1: Enable
14	EXTMODEEN	R/W	Extended Mode Enable In extended mode, SMC_WRTTIM register can be used to realize read and write using different timing function. 0: Disable 1: Enable
15	WSASYNCEN	R/W	Wait Signal During Asynchronous Transfers Enable This bit is used to enable SMC to use NWAIT signal during asynchronous protocol period. 0: Disable 1: Enable
18:16	CRAMPsizeCFG	R/W	CRAM Page Size Configure 000: There is no burst split when crossing the page boundary 001: 128 bytes 010: 256 bytes 011: 512 bytes 100: 1024 bytes Others: Reserved
19	WRBURSTEN	R/W	Write PSRAM Burst Enable This bit is used to enable the synchronous burst transmission protocol for write operation. 0: Write operation is asynchronous mode 1: Write operation is synchronous mode
31:20	Reserved		

4.7.1.2 SRAM/NOR flash memory chip selection timing register 1...4 (SMC_CSTIM1...4)

Offset address: $0x04 + 8*(x-1)$, $x=1...4$

Reset value: 0x0FFF FFFF

Field	Name	R/W	Description
3:0	ADDRSETCFG	R/W	Address Setup Time Configure Only apply to NOR flash memory operation in SRAM, ROM and asynchronous bus multiplexing mode. 0000: One HCLK clock cycle 0001: 2 HCLK clock cycles 1111: 16 HCLK clock cycles Note: In synchronous operation, this parameter is meaningless and is always 1 memory clock cycle
7:4	ADDRHLDCFG	R/W	Address-Hold Time Configure Only apply to NOR flash memory operation in SRAM, ROM and asynchronous bus multiplexing mode. 0000: Reserved

Field	Name	R/W	Description
			0001: 2 HCLK clock cycles 1111: 16 HCLK clock cycles Note: In synchronous operation, this parameter is meaningless and is always 1 memory clock cycle
15:8	DATASETCFG	R/W	Data Setup Time Configure Only apply to NOR flash memory operation in SRAM, ROM and asynchronous bus multiplexing mode. 0000 0000: Reserved 0000 0001: 2 HCLK clock cycles 0000 0010: 3 HCLK clock cycles 1111 1111: 256 HCLK clock cycles
19:16	BUSTURNCFG	R/W	Bus Turnaround Phase Duration Configure These bits are used to configure the delay time on the bus after a read operation. They are only applicable to NOR flash memory operation in bus multiplexing mode. 0000: 1 HCLK clock cycle 0001: 2 HCLK clock cycles 1111: 16 HCLK clock cycles
23:20	CLKDIVCFG	R/W	Clock Divide Factor Configure CLK comes from HCLK frequency division. These bits are used to configure the frequency of CLK clock output signal. They are only applicable to synchronous mode. 0000: Reserved 0001: 2 divided frequency 0010: 3 divided frequency 1111: 16 divided frequency Note: This parameter is ineffective when accessing asynchronous NOR flash memory, SRAM or ROM.
27:24	DATALATCFG	R/W	Data Latency Configure These bits are used to configure the number of memory cycles for waiting before reading the first data. They are only applicable to NOR flash memory operation in synchronous burst mode. 0000: 2 CLK clock cycles 0001: 3 CLK clock cycles 1111: 17 CLK clock cycles Note: When accessing asynchronous NOR flash memory, SRAM or ROM, this parameter is invalid. When operating CRAM, this parameter is 0.
29:28	ASYNACCCFG	R/W	Asynchronous Access Mode Configure Valid only when EXTMODEEN bit of SMC_CSCTRLX register is 1. 00: Access mode A 01: Access mode B 10: Access mode C

Field	Name	R/W	Description
			11: Access mode D
31:30	Reserved		

4.7.1.3 SRAM/NOR flash memory write timing register 1...4 (SMC_WRTTIM1...4)

Offset address: 0x104 + 8*(x-1), x=1...4

Reset value: 0x0FFF FFFF

Field	Name	R/W	Description

4.7.2.6 ECC result register 2/3 (SMC_ECCRS2/3)

Offset address: $0x54 + 0x20 * (x-1)$, $x=2$ or 3

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	ECCRS	R	ECC result

5 System configuration controller (SYSCFG)

5.1 Main characteristics

- (1) Remapping of configuration memory
- (2) Select MAC PHY interface
- (3) Configure external interrupt of GPIO
- (4) Control I/O compensation cell

5.2 I/O compensation cell

When the I/O output buffer speed is configured as 50MHz or 100MHz, the I/O port noise will affect the power supply voltage. Therefore, at this time (when the power supply voltage is 2.4~3.6V), the compensation cell can be enabled to control the $t_{r(I/O)out}/t_{r(I/O)out}$ slope to reduce the impact on the power supply.

5.3 Register address mapping

Table 27 SYSCFG Register Address Mapping

Register name	Description	Offset address
SYSCFG_MMSEL	Memory mapping selection register	0x00
SYSCFG_PMCFG	Peripheral mode configuration register	0x04
SYSCFG_EINTCFG1	External interrupt register 1	0x08
SYSCFG_EINTCFG2	External interrupt register 2	0x0C
SYSCFG_EINTCFG3	External interrupt register 3	0x10
SYSCFG_EINTCFG4	External interrupt register 4	0x14
SYSCFG_CCCTRL	Compensation cell control register	0x20

5.4 Register functional description

5.4.1 Memory mapping selection register (SYSCFG_MMSEL)

Offset address: 0x00

Reset value: 0x0000 000X (after reset, the value of X is the same as the setting of BOOT pin)

This register is used to configure in the memory area accessed at the address 0x0000 0000 through the software so as to bypass BOOT pin.

Field	Name	R/W	Description
1:0	MMSEL	R/W	Memory Mapping Select Control the memory mapping address 0x0000 0000. After reset, the parameters of these bits are determined by actual BOOT. 00: Main flash mapping address: 0x0000 0000 01: System flash mapping address: 0x0000 0000 10: SMC Bank1 (NOR/PSRAM1 and 2) mapping address: 0x0000 0000 11: Embedded SRAM1 mapping address: 0x0000 0000
31:2	Reserved		

5.4.2 Peripheral mode configuration register (SYSCFG_PMCFG)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
22:0	Reserved		
23	ENETSEL	R/W	Ethernet PHY Interface Select Control the physical layer interface. 0: MII interface 1: RMII PHY interface Note: This bit shall be operated when ENET is reset and before ENET clock is enabled.
31:24	Reserved		

5.4.3 External interrupt register 1 (SYSCFG_EINTCFG1)

The selected external interrupt sources represented by values of the EINTx [3:0] of the following several SYSCFG external interrupt registers are shown in the table below.

Table 28 External Interrupt Sources Selected for Different Values

EINTx [3:0]	External interrupt source
0000	PA[x] pin
0001	PB[x] pin
0010	PC[x] pin
0011	PD[x] pin
0100	PE[x] pin
0101	PF[x] pin
0110	PG[x] pin
0111	PH[x] pin
Others	Reserved

Offset address: 0x08

Reset value: 0x0000 0000

These bits are controlled by software to be rewritten to select the external interrupt source of EINTx(x=0...3).

Field	Name	R/W	Description
3:0	EINT0	R/W	EINT0 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT0.
7:4	EINT1	R/W	EINT1 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT1.
11:8	EINT2	R/W	EINT2 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT2. Note that when the value of this bit is 0x0111, this bit is reserved bit, namely, PH[2] is unused.
15:12	EINT3	R/W	EINT3 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT3. Note that when the value of this bit is 0x0111, this bit is reserved bit, namely, PH[3] is unused.
31:16	Reserved		

5.4.4 External interrupt register 2 (SYSCFG_EINTCFG2)

Offset address: 0x0C

Reset value: 0x0000 0000

These bits are controlled by software to be rewritten to select the external interrupt source of EINTx(x=4...7).

Note that when the value of each bit of the register is 0x0111, this bit is reserved bit, namely, PH[7:4] is unused.

Field	Name	R/W	Description
3:0	EINT4	R/W	EINT4 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT4.
7:4	EINT5	R/W	EINT5 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT5.
11:8	EINT6	R/W	EINT6 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT6.
15:12	EINT7	R/W	EINT7 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT7.
31:16	Reserved		

5.4.5 External interrupt register 3 (SYSCFG_EINTCFG3)

Offset address: 0x10

Reset value: 0x0000 0000

These bits are controlled by software to be rewritten to select the external interrupt source of EINTx(x=8...11).

Note that when the value of each bit of the register is 0x0111, this bit is reserved bit, namely, PH[11:8] is unused.

Field	Name	R/W	Description
3:0	EINT8	R/W	EINT8 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT8.
7:4	EINT9	R/W	EINT9 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT9.
11:8	EINT10	R/W	EINT10 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT10.
15:12	EINT11	R/W	EINT11 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT11.
31:16	Reserved		

5.4.6 External interrupt register 4 (SYSCFG_EINTCFG4)

Offset address: 0x14

Reset value: 0x0000 0000

These bits are controlled by software to be rewritten to select the external interrupt source of EINTx(x=12...15).

Note that when the value of each bit of the register is 0x0111, this bit is reserved bit, namely, PH[15:12] is unused.

Field	Name	R/W	Description
3:0	EINT12	R/W	EINT12 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT12.
7:4	EINT13	R/W	EINT13 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT13.
11:8	EINT14	R/W	EINT14 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT14.
15:12	EINT15	R/W	EINT15 Configure These bits are controlled by software to be rewritten to select the external interrupt source of EINT15.
31:16	Reserved		

5.4.7 Compensation cell control register (SYSCFG_CCCTRL)

Offset address: 0x20

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	CCPD	R/W	Compensation Cell Power-down 0: I/O compensation cell enters power-down mode 1: I/O compensation cell is enabled
7:1	Reserved		
8	RDYFLG	R	Compensation Cell Ready Flag 0: Not ready 1: Ready
31:9	Reserved		

6 Reset and clock (RCM)

6.1 Full name and abbreviation description of terms

Table 29 Full name and abbreviation description of terms

Full name in English	English abbreviation
Reset and Clock Management	RCM
Reset	RST
Power-On Reset	POR
Power-Down Reset	PDR
High Speed External Clock	HSECLK
Low Speed External Clock	LSECLK
High Speed Internal Clock	HSICKL
Low Speed Internal Clock	LSICKL
Phase Locked Loop	PLL
Main clock output	MCO
Calibrate	CAL
Trim	TRM
Clock Security System	CSS
Non Maskable Interrupt	NMI

6.2 Reset management unit (RMU)

The reset is divided into three forms, namely, system reset, power reset and backup domain reset.

6.2.1 System reset

6.2.1.1 "System reset" reset source

The reset source is divided into external reset source and internal reset source.

External reset source:

- Low level on NRST pin.

Internal reset source:

- Window watchdog termination count (WWDT reset)
- Independent watchdog termination count (IWDT reset)
- Software reset (SW reset)
- Power reset
- Low-power management reset

A system reset will occur in case of any of the above events. Besides, the reset event source can be identified by viewing the reset flag bit in RCM_CSTS (control/state register).

When the system is reset, all registers except the registers in RCM_CSTS (control/state register) reset flag bit and backup domain will be reset to the reset state.

Software reset

Software can be reset by setting SYSRESETREQ in Arm® Cortex® -M4F interrupt application and reset control register to "1".

Low-power management reset

Low-power management may reset in two cases, one is when entering the standby mode, and the other is when entering the stop mode. In these two cases, if RSTSTDB (in standby mode) or RSTSTOP (in stop mode) in user selection byte is set to "1", the system will be reset rather than entering the standby or stop mode.

6.2.1.2 "System Reset" reset circuit

The reset source is used in the NRST pin, which remains low in reset process.

The internal reset source generates a delay of at least 20μs pulse on the NRST pin through the pulse generator, which causes the NRST to maintain the level to generate reset; the external reset source directly pulls down the NRST pin level to generate reset.

The "system reset" reset circuit is shown in the figure below.

Figure 3 "System Reset" Reset Circuit

6.2.2 Power reset

"Power reset" reset source

"Power reset" reset source is as follows:

- Power-on reset (POR)
- Power-down reset (PDR)
- Brownout reset (BOR)
- Exit (wake up) from standby mode

A power reset will occur in case of any of the above events.

Power reset will reset all registers except that in backup domain.

6.2.3 Backup domain reset

"Backup domain reset" reset source

"Backup domain reset" reset source is as follows:

- Software resets and sets the BDRST bit in RCM_BDCTRL (backup domain control register)
- V_{DD} or V_{BAT} is powered on again when V_{DD} and V_{BAT} is powered down

A backup domain reset will occur in case of any of the above events.

The backup domain reset has two special resets, which only affect backup domain.

6.3 Clock management unit (CMU)

The clock sources of the whole system are: HSECLK, LSECLK, HSICLK, LSICLK, PLL1 and PLL2. For the characteristics of the clock source, please refer to the relevant chapter of "Electrical Characteristics" in the data manual.

6.3.1 External clock source

The external clock signal includes HSECLK (high-speed external clock signal) and LSECLK (low-speed external clock signal).

There are two kinds of external clock sources:

- External crystal/ceramic resonator
- External clock of user

The hardware configuration of the two kinds of clock sources is shown in the figure below.

Figure 4 HSECLK/LSECLK Clock Source Hardware Configuration

Clock source	Hardware configuration
External clock	
Crystal/ceramic resonator	

In order to reduce the distortion of clock output and shorten the start-up stabilization time, the crystal/ceramic resonator and load capacitor must be as close to the oscillator pin as possible. The value of load capacitance (C_{L1} , C_{L2}) must be adjusted according to the selected oscillator.

6.3.1.1 HSECLK high-speed external clock signal

HSECLK clock signal is generated by HSECLK external crystal/ceramic resonator and HSECLK external clock two kinds of clock sources.

Table 30 Clock Source Generating HSECLK

Name	Description
External clock source (HSECLK bypass)	<p>Provide clock to MCU through OSC_IN pin.</p> <p>The signal can be generated by ordinary function signal transmitter (in debugging), crystal oscillator and other signal generators; the waveform can be square wave, sine wave or triangle wave with 50% duty cycle, and the maximum frequency is up to 26MHz.</p> <p>For hardware connection, it must be connected to OSC_IN pin, ensuring OSC_OUT pin is suspended (in high-impedance state); for MCU configuration, the user can select this mode by setting HSEBCFG and HSEEN bits in RCM_CTRL (clock control register).</p>
External crystal/ceramic resonator (HSECLK crystal)	<p>The clock is provided to MCU by the resonator, and the resonator includes crystal resonator and ceramic resonator.</p> <p>The frequency range is 4-26MHz.</p> <p>When needing to connect OSC_IN and OSC_OUT to the resonator, it can be enabled and disabled by setting the HSEEN bit in clock control register RCM_CTRL (clock control register).</p> <p>HSERDYFLG bit in the clock control register RCM_CTRL (clock control register) is used to indicate whether the high-speed external oscillator is stable. After startup, the clock is not released until this bit is set to "1" by hardware. If interrupt is allowed in RCM_INT (clock interrupt register), corresponding interrupt will be generated.</p>

6.3.1.2 LSECLK low-speed external clock signal

LSECLK clock signal is generated by LSECLK external crystal/ceramic resonator and LSECLK external clock two kinds of clock sources.

Table 31 Clock Source Generating LSECLK

Name	Description
External clock source (LSECLK bypass)	<p>The clock is provided to MCU through OSC32_IN pin.</p> <p>The signal can be generated by ordinary function signal transmitter (in debugging), crystal oscillator and other signal generators; the waveform can be square wave, sine wave or triangle wave with 50% duty cycle, and the signal frequency needs to be 32.768kHz.</p> <p>For hardware connection, it must be connected to OSC32_IN pin, ensuring OSC32_OUT pin is suspended; for MCU configuration, the user can select this mode by setting LSEBCFG and LSEEN bits in RCM_BDCTRL (backup domain control register).</p>

Name	Description
External crystal/ceramic resonator (LSECLK crystal)	<p>The clock is provided to MCU by the resonator, and the resonator includes crystal resonator and ceramic resonator. The frequency is 32.768kHz.</p> <p>OSC32_IN and OSC32_OUT need to be connected to the oscillator which can be enabled and disabled through LSEEN bit in RCM_BDCTRL (clock backup domain control register).</p> <p>LSERDYFLG in RCM_BDCTRL indicates whether LSECLK crystal oscillator is stable. At startup stage, LSECLK clock signal is not released until this bit is set to "1" by hardware. If it is allowed in the clock interrupt register, an interrupt request can be generated.</p>

6.3.2 Internal clock source

The internal clock includes HSICLK (high-speed internal clock signal) and LSICLK (low-speed internal clock signal).

6.3.2.1 HSICLK high-speed internal clock signal

HSICLK clock signal is generated by internal 16MHz RC oscillator.

The RC oscillator frequency of different chips is different, and that of the same chip may be different with the change of temperature and voltage; the HSICLK clock frequency of each chip has been calibrated to 1% (25°C, $V_{DD}=V_{DDA}=3.3V$) by the manufacturer before leaving the factory. When the system is reset, the value calibrated by the manufacturer will be loaded to RCM_CTRL register; in addition, the users can further adjust the frequency by setting HSITRM bit in RCM_CTRL register according to the application environment (temperature and voltage) of the site.

HSIRDYFLG bit can be used to indicate whether HSICLK RC oscillator is stable. In the clock startup process, HSICLK RC output clock is not released until the HSIRDYFLG bit is set to 1 by hardware. HSICLK RC can be enabled or disabled by HSIEN bit in RCM_CTRL.

Compared with HSECLK crystal oscillator, RC oscillator can provide system clock without any external device; the start time of RC oscillator is shorter than that of HSECLK crystal oscillator; even after calibration, its clock frequency accuracy is still inferior to that of HSECLK crystal oscillator.

6.3.2.2 LSICLK low-speed internal clock signal

Main characteristics of LSICLK

LSICLK is generated by RC oscillator, within the range of 28kHz (20kHz and 35kHz). The frequency may change along with the change of temperature and voltage. It can keep running in stop and standby mode and provide clock for independent watchdog and automatic wake-up unit.

LSICLK can be enabled or disabled by LSIEN bit in RCM_CSTS register. LSIRDYFLG bit in RCM_CSTS indicates whether the low-speed internal oscillator is stable. At startup stage, the clock is not released until this bit is set to "1" by hardware. If allowed in RCM_INT register, LSICLK ready interrupt request signal will be generated.

6.3.3 PLL phase locked loop

This series of products have two PLL, which usually take HSICLK or HSECLK oscillator as their clock source. These two PLL will be disabled by hardware in case of either of the following situations:

- Enter the stop or standby state
- The system clock directly or indirectly selects HSECLK as the clock source, and a fault occurs to HSECLK

When configuring PLL related coefficient, ensure that it is not enabled.

6.3.3.1 PLL1

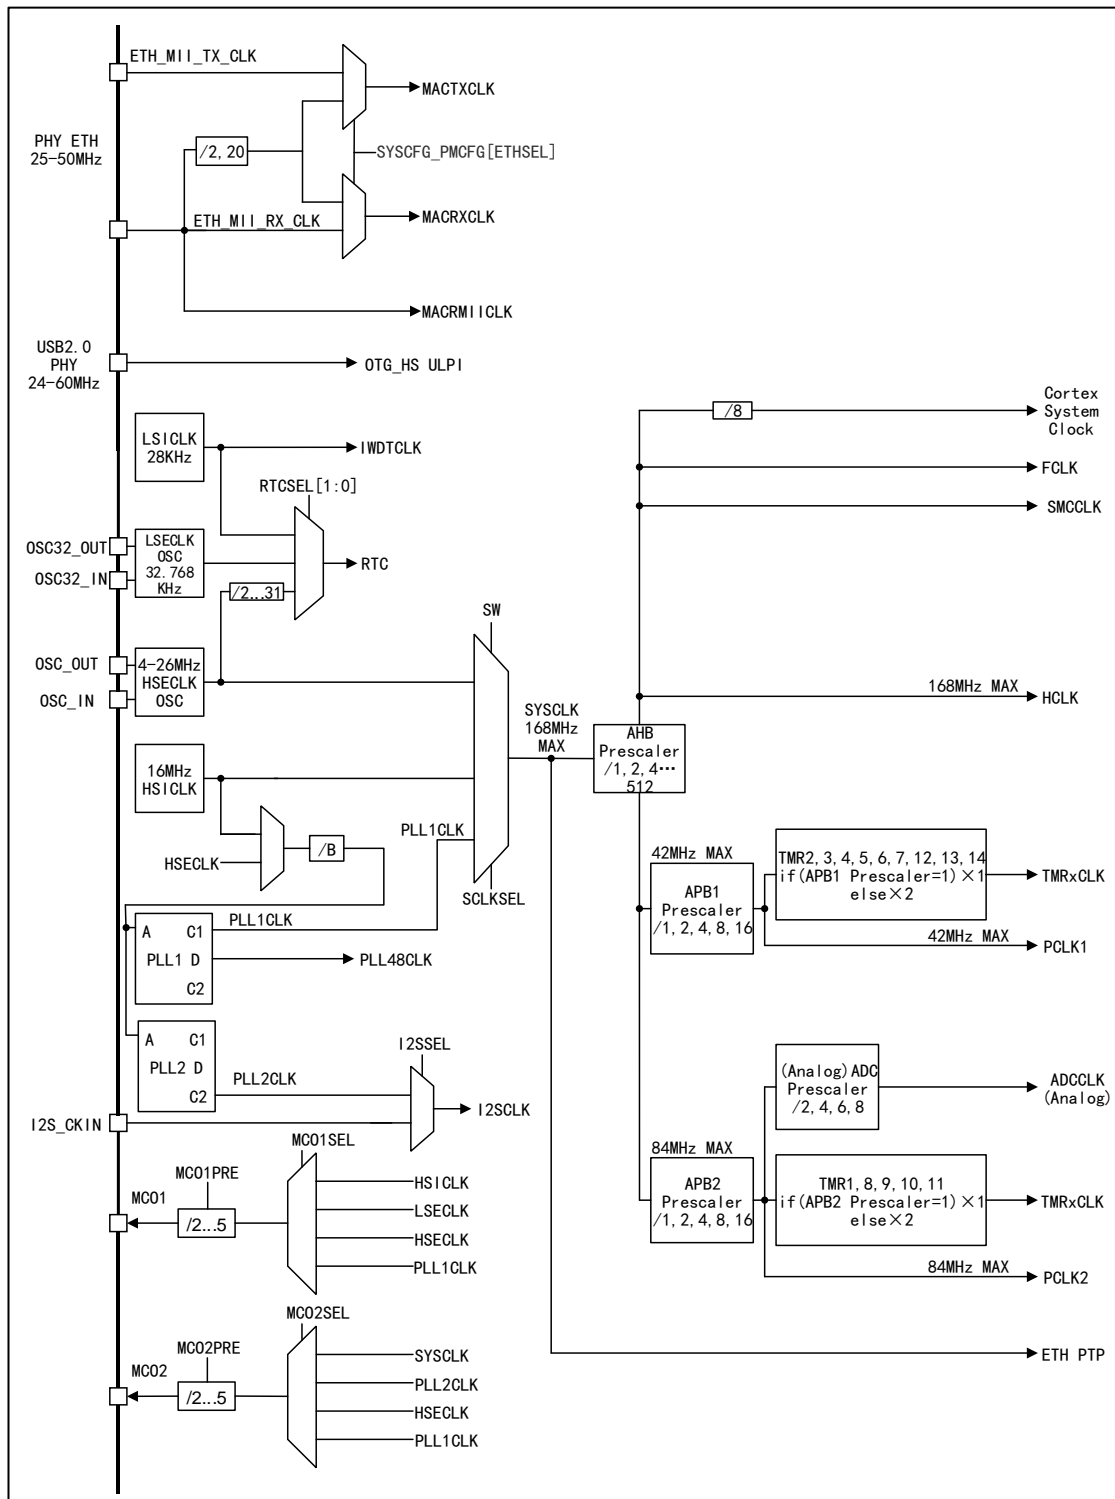

PLL1 is the main phase-locked loop, which mainly generates the clock signal with maximum frequency of 168MHz for the system clock. The clock output frequency of PLL1 is configured by RCM_PLL1CFG register, the clock frequency is adjusted by setting the multiplication/division factor in the formula, and PLL1 shall be disabled during configuration.

6.3.3.2 PLL2

PLL2 is dedicated to providing clock signal to I2S, and the clock frequency is jointly determined by the related bits in RCM_PLL1CFG and RCM_PLL2CFG registers (see the register function description for details).

6.3.4 Clock tree

Figure 5 APM32A407xGT7 Clock Tree

Note:

- (1) HCLK means AHB clock signal.
- (2) PLCK1 and PLCK2 are clock signal connected to APB1 and APB2 respectively.

- (3) FCLK is free running clock of Arm® Cortex®-M4F with FPU.
- (4) The frequency of AHB, APB2 (high-speed APB) and APB1 (low-speed APB) domains can be configured through multiple prescalers. Besides, the maximum frequency of AHB domain is 168MHz, the maximum frequency of APB2 domain is 84MHz, and the maximum allowable frequency of APB1 is 42MHz.
- (5) The maximum frequency obtained by the system clock is 168MHz.
- (6) The clock source of OTG_FS is PLL1CLK with frequency of 48MHz, and the clock source of UTML PHY of OTG_HS1 is from external quartz clock. For OTG_HS2, since it adopts on-chip PHY and has internal PLL to output 60MHz to UTML PHY, the clock source of its 48MHz clock is from PLL48CLK.
- (7) Only when the corresponding enable bits are set, can the peripheral obtain the clock signal.
- (8) ADC clock can be divided into analog circuit clock and digital circuit clock. The clock management unit provides a prescaler for the analog circuit clock of ADC, so that the ADC can work at the clock frequency of PCLK2 after 2/4/6/8 frequency division, and at this time the clock can be used by all ADC; the clock frequency of digital circuit of ADC is equal to PCLK2, and ADC1/2/3 clocks can be enabled respectively through the corresponding bits of RCM_APB2CLKEN register.
- (9) SysTick (system timer) can be provided by the clock signal after frequency division of HCLK8. Different clock sources can be selected by setting SysTick control and status register.
- (10) Frequency assignment of all TMRxCLK (timer clocks) is automatically set by the hardware according to the following two situations:
 - If the corresponding APB prescaler factor is 1, the clock frequency of the timer is the same as that of the APB bus.
 - Otherwise, the clock frequency of the timer will be set to twice the frequency of the APB bus connected to it.
- (11) The maximum output frequency of MCO1/2 is 100MHz
- (12) For the structure of PLL1 and pll2, please refer to PLL Phase Locked Loop and RCM_PLLxCFG registers.

6.3.5 Clock source selection of RTC

By setting RTCSRCSEL bit in RCM_BDCTRL (backup domain control register), you can select to divide the frequency of HSECLK into 1MHz clock signal, and use LSECLK or LSICLK as the clock source of RTC. The selection of clock source can be changed only when the backup domain is reset.

Because LSECLK is in the backup domain, and HSECLK and LSICLK are not in the backup domain, different RTC clocks will be selected as the clock source of RTC; the working condition of RTC is different, and see the following table for details:

Table 32 Working Condition of RTC When Different Clock Sources are Selected

Clock source	Working condition
LSECLK is selected as RTC clock	As long as V_{BAT} maintains power supply, RTC will continue to work even if V_{DD} is powered off
LSICLK is selected as automatic wake-up unit clock	If V_{DD} is powered off, the automatic wake-up unit state cannot be guaranteed.
HSECLK is used as RTC clock after frequency division	If the V_{DD} is powered off or the internal voltage regulator is disabled (the power supply of 1.3V domain is cut off), the RTC state is uncertain, so the BPWEN bit (cancel the write protection of backup domain) of PMU_CTRL (power control register) must be set to "1".

6.3.6 Clock source selection of IWDT

When IWDT (independent watchdog) is opened, LSICLK oscillator will be opened by force, and when it is stable, the clock signal will be provided to IWDT. After LSICLK is opened by force, it will always be open and cannot be closed.

6.3.7 Clock source selection of MCO

There are two microcontroller clock output pins, MCO1 (PA8) and MCO2 (PC9). When the corresponding GPIO ports of ports (PA8 and PC9) are configured as the corresponding multiplexing function, the clock signal can be selected to be output to MCO pin by configuring MCOxSEL bit and MCOxPSC bit in RCM_CFG (clock configuration register). See the clock tree or register functional description for specific clock signal.

6.3.8 Clock source selection of SYSCLK

After system reset, HSICLK oscillator will (directly or indirectly) be selected as the system clock, and cannot be stopped. If you want to switch the SYSCLK clock source, you must wait until the destination clock source is ready (i.e. the destination clock source is stable). The target clock source can be HSICLK, HSECLK and PLLCLK.

The state bit of RCM_CTRL and RCM_CFG registers can indicate the ready clock and selected SYSCLK clock source.

6.3.9 CSS clock security system

In order to prevent MCU from normal operation due to external crystal oscillator short circuit, MCU can activate CSS clock security system through software. After the security system is activated, if the HSECLK oscillator is used as the system clock directly or indirectly (used as the PLL input clock and PLL is used as the system clock), the external HSECLK oscillator will be disabled when the HSECLK fails, and the system clock will automatically switch to HSICLK. At this time, the PLLCLK which selects HSECLK as the clock input and as the system clock input source will also be disabled.

Note: When CSS is activated by software and HSECLK fails, CSS interrupt and NMI (non-maskable interrupt) will be generated. Since NMI is executed continuously before CSS interrupt is cleared, CSSCLR bit in RCM_INT register shall be set to clear the interrupt.

6.3.10 TMR5-based internal/external clock measurement

Through the input capture function of TMR5 Channel 4, the frequency of certain clock source generators can be indirectly measured. The circuit diagram is as follows:

Figure 6 TMR5 Measurement Clock Frequency Circuit Diagram

Channel 4 of TMR5 can select to connect one GPIO port or one MCU internal clock by configuring RMPSEL bit of TMR5_OPT register

6.3.11 TMR11-based internal/external clock measurement

The external oscillator frequency can be tested through TMR11 when HSI CLK is used as the system clock source. As shown in the figure below, the user can select to trigger T11 by I/O port or internal clock by configuring the RMPSEL bit of TMR11_OPT register.

Figure 7 TMR11 Measurement Clock Frequency Circuit Diagram

6.4 Register address mapping

Table 33 RCM Register Address Mapping

Register name	Description	Offset address
RCM_CTRL	Clock control register	0x00
RCM_PLL1CFG	PLL1 configuration register	0x04
RCM_CFG	Clock configuration register	0x08

Register name	Description	Offset address
RCM_INT	Clock interrupt register	0x0C
RCM_AHB1RST	AHB1 peripheral reset register	0x10
RCM_AHB2RST	AHB2 peripheral reset register	0x14
RCM_AHB3RST	AHB3 peripheral reset register	0x18
RCM_APB1RST	APB1 peripheral reset register	0x20
RCM_APB2RST	APB2 peripheral reset register	0x24
RCM_AHB1CLKEN	AHB1 peripheral clock enable register	0x30
RCM_AHB2CLKEN	AHB2 peripheral clock enable register	0x34
RCM_AHB3CLKEN	AHB3 peripheral clock enable register	0x38
RCM_APB1CLKEN	APB1 peripheral clock enable register	0x40
RCM_APB2CLKEN	APB2 peripheral clock enable register	0x44
RCM_LPAHB1CLKEN	AHB1 peripheral clock enable register in low-power mode	0x50
RCM_LPAHB2CLKEN	AHB2 peripheral clock enable register in low-power mode	0x54
RCM_LPAHB3CLKEN	AHB3 peripheral clock enable register in low-power mode	0x58
RCM_LPAPB1CLKEN	APB1 peripheral clock enable register in low-power mode	0x60
RCM_LPAPB2CLKEN	APB2 peripheral clock enable register in low-power mode	0x64
RCM_BDCTRL	Backup domain control register	0x70
RCM_CSTS	Clock control/state register	0x74
RCM_SSCCFG	Spread spectrum clock configuration register	0x80
RCM_PLL2CFG	PLL2 configuration register	0x84

6.5 Register functional description

6.5.1 Clock control register (RCM_CTRL)

Offset address: 0x00

Reset value: 0x0000 XX83; X means undefined

Access: Access in the form of word, half word and byte, without wait cycle

Field	Name	R/W	Description
0	HSIEN	R/W	<p>High Speed Internal Clock Enable Set to 1 or cleared by software.</p> <p>HSICLK is an RC oscillator. When one of the following conditions occurs, it will be set to 1 by the hardware: power-on start, software reset, wake-up from standby mode, wake-up from stop mode, failure of external high-speed clock source (as system clock or providing system clock through PLL). When HSICLK is used as system clock or provides system clock through PLL, this bit cannot be cleared.</p> <p>0: HSICLK RC oscillator is disabled 1: HSICLK RC oscillator is turned on</p>
1	HSIRDYFLG	R	<p>High Speed Internal Clock Ready Flag</p> <p>0: HSICLK RC oscillator is not stable 1: HSICLK RC oscillator is stable</p>
2	Reserved		
7:3	HSITRM	R/W	<p>High Speed Internal Clock Trim</p> <p>HSICLK has been calibrated to 16MHz±1% when the product leaves the factory. However, it changes as the temperature and voltage changes, but the frequency of HSICLK RC oscillator can be adjusted by this bit.</p>
15:8	HSICAL	R	<p>High Speed Internal Clock Calibrate</p> <p>HSICLK has been calibrated to 16MHz±1% when the product leaves the factory. When the system is started up, the calibration parameters will be automatically written to the register.</p>
16	HSEEN	R/W	<p>High Speed External Clock Enable</p> <p>When entering the standby or stop mode, this bit is cleared by hardware and HSECLK is turned off; when HSECLK is used as system clock source or the system clock is provided through PLL, this bit cannot be cleared.</p> <p>0: Disable 1: Enable</p>
17	HSERDYFLG	R	<p>High Speed External Clock Ready Flag</p> <p>When HSECLK is stable, this bit will be set to 1 by hardware and set to 0 by software.</p> <p>0: HSECLK is not stable 1: HSECLK is stable</p>
18	HSEBCFG	R/W	<p>High Speed External Clock Bypass Configure</p> <p>Bypass mode refers to the mode in which external clock is used as the HSECLK clock source; otherwise the resonator is used as the HSECLK clock source.</p> <p>0: Non-bypass mode 1: Bypass mode</p>
19	CSSSEN	R/W	<p>Clock Security System Enable</p> <p>0: Disable 1: Enable</p> <p>Note: This bit can be set to 1 only when HSECLK resonator is stable.</p>
23:20	Reserved		

Field	Name	R/W	Description
24	PLL1EN	R/W	<p>PLL1 Enable</p> <p>When entering the standby and stop mode, this bit is cleared to 0 by the hardware; when PLL1CLK has been configured as the clock source of the system clock (or in the process of configuration), this bit cannot be set to 0; in other cases, it can be set to 1 or 0 by the software.</p> <p>0: PLL1 is disabled 1: PLL2 is enabled</p>
25	PLL1RDYFLG	R	<p>PLL1 Clock Ready Flag</p> <p>PLL1 is set to 1 by hardware after it is locked.</p> <p>0: PLL1 is unlocked 1: PLL1 is locked</p>
26	PLL2EN	R/W	<p>PLL2 Enable</p> <p>When entering the standby and stop mode, this bit is cleared to 0 by the hardware.</p> <p>0: PLL2 is disabled 1: PLL2 is enabled</p>
27	PLL2RDYFLG	R	<p>PLL2 Clock Ready Flag</p> <p>PLL2 is set to 1 by hardware after it is locked.</p> <p>0: PLL2 is unlocked 1: PLL2 is locked</p>
31:28	Reserved		

6.5.2 PLL1 configuration register (RCM_PLL1CFG)

Offset address: 0x04

Reset value: 0x2400 3010

Access in the form of word, half word and byte, without wait cycle.

The register is used to configure various parameters so as to output different clock signals.

$$f_{(VCO\ clock)} = f_{(PLL1\ clock\ input)} \times (PLL1A/PLL1B)$$

$$f_{(PLL1\ clock\ output)} = f_{(VCO\ clock)} / PLL1C$$

$$f_{(OTG_FS_SDIO_RNG\ clock\ output)} = f_{(VCO\ clock)} / PLL1D$$

Field	Name	R/W	Description

6.5.4 Clock interrupt register (RCM_INT)

Offset address: 0x0C

Reset value: 0x0000 0000

Access: Access in the form of word, half word and byte, without wai cycle.

Field	Name	R/W	Description
0	LSIRDYFLG	R	LSICLK Ready Interrupt Flag When LSICLK is stable and LSIRDYEN bit is set to 1, this bit will be set to 1 by hardware; when LSIRDYCLR is set to 1 by software, this bit will be cleared. 0: No LSICLK ready interrupt 1: LSICLK ready interrupt occurred
1	LSERDYFLG	R	LSECLK Ready Interrupt Flag When LSECLK is stable and LSEIRDYEN bit is set to 1, this bit will be set to 1 by hardware; when LSEIRDYCLR is set to 1 by software, this bit will be cleared. 0: No LSECLK ready interrupt 1: LSECLK ready interrupt occurred
2	HSIRDYFLG	R	HSICLK Ready Interrupt Flag When HSICLK is stable and HSIRDYEN bit is set to 1, this bit will be set to 1 by hardware; when HSIRDYCLR is set to 1 by software, this bit will be cleared. 0: No HSICLK ready interrupt 1: HSICLK ready interrupt occurred
3	HSERDYFLG	R	HSECLK Ready Interrupt Flag When HSECLK is stable and HSEIRDYEN bit is set to 1, this bit will be set to 1 by hardware; when HSEIRDYCLR is set to 1 by software, this bit will be cleared. 0: No HSECLK ready interrupt 1: HSECLK ready interrupt occurred
4	PLL1RDYFLG	R	PLL1 Ready Interrupt Flag When PLL1 is stable and PLL1RDYEN bit is set to 1, this bit will be set to 1 by hardware; when PLL1RDYCLR is set to 1 by software, this bit will be cleared. 0: PLL1 clock ready interrupt does not occur 1: PLL1 clock ready interrupt occurred
5	PLL2RDYFLG	R	PLL2 Ready Interrupt Flag When PLL2 is stable and PLL2RDYEN bit is set to 1, this bit will be set to 1 by hardware; when PLL2RDYCLR is set to 1 by software, this bit will be cleared. 0: PLL2 clock ready interrupt does not occur 1: PLL2 clock ready interrupt occurred

Field	Name	R/W	Description
6	Reserved		
7	CSSFLG	R	<p>Clock Security System Interrupt Flag</p> <p>When the external high-speed oscillator clock fails, it is set to 1 by hardware.</p> <p>When CSSCLR is set to 1 by software, this bit will be cleared.</p> <p>0: No security system interrupt caused by HSE clock failure</p> <p>1: Clock security system interrupt is caused by HSE clock failure</p>
8	LSIRDYEN	R/W	<p>LSICLK Ready Interrupt Enable</p> <p>Enable or disable internal 28kHz RC oscillator ready interrupt.</p> <p>0: Disable</p> <p>1: Enable</p>
9	LSERDYEN	R/W	<p>LSECLK Ready Interrupt Enable</p> <p>Enable external 32kHz RC oscillator ready interrupt.</p> <p>0: Disable</p> <p>1: Enable</p>
10	HSIRDYEN	R/W	<p>HSICLK Ready Interrupt Enable</p> <p>Enable the internal 8MHz RC oscillator ready interrupt.</p> <p>0: Disable</p> <p>1: Enable</p>
11	HSERDYEN	R/W	<p>HSCLKE Ready Interrupt Enable</p> <p>Enable external 4-16MHz oscillator ready interrupt.</p> <p>0: Disable</p> <p>1: Enable</p>
12	PLL1RDYEN	R/W	<p>PLL1 Ready Interrupt Enable</p> <p>Enable PLL1 ready interrupt.</p> <p>0: Disable</p> <p>1: Enable</p>
13	PLL2RDYEN	R/W	<p>PLL2 Ready Interrupt Enable</p> <p>Enable PLL2 ready interrupt.</p> <p>0: Disable</p> <p>1: Enable</p>
15:14	Reserved		
16	LSIRDYCLR	W	<p>LSICLK Ready Interrupt Clear</p> <p>Clear LSI ready interrupt flag bit LSIRDYFLG.</p> <p>0: No effect</p> <p>1: Clear</p>
17	LSERDYCLR	W	<p>LSECLK Ready Interrupt Clear</p> <p>Clear LSE ready interrupt flag bit LSERDYFLG.</p> <p>0: No effect</p> <p>1: Clear</p>
18	HSIRDYCLR	W	<p>HSICLK Ready Interrupt Clear</p> <p>Clear HSI ready interrupt flag bit HSIRDYFLG.</p> <p>0: No effect</p> <p>1: Clear</p>

Field	Name	R/W	Description
19	HSERDYCLR	W	HSECLK Ready Interrupt Clear Clear HSE ready interrupt flag bit HSERDYFLG. 0: No effect 1: Clear
20	PLL1RDYCLR	W	PLL1 Ready Interrupt Clear Clear PLL1 ready interrupt flag bit PLL1RDYFLG. 0: No effect 1: Clear
21	PLL2RDYCLR	W	PLL2 Ready Interrupt Clear Clear PLL2 ready interrupt flag bit PLL2RDYFLG. 0: No effect 1: Clear
22	Reserved		
23	CSSCLR	W	Clock Security System Interrupt Clear Clear the security system interrupt flag bit CSSFLG. 0: No effect 1: Clear
31:24	Reserved		

6.5.5 AHB1 peripheral reset register (RCM_AHB1RST)

Offset address: 0x10

Reset value: 0x0000 0000

Access: Access in the form of word, half word and byte, without wait cycle.

Field	Name	R/W	Description
0	PARST	R/W	GPIOA Reset 0: No effect 1: Reset
1	PBRST	R/W	GPIOB Reset 0: No effect 1: Reset
2	PCRST	R/W	GPIOC Reset 0: No effect 1: Reset
3	PDRST	R/W	GIOD Reset 0: No effect 1: Reset
4	PERST	R/W	GPIOE Reset 0: No effect 1: Reset
5	PFRST	R/W	GPIOF Reset 0: No effect 1: Reset

Field	Name	R/W	Description
6	PGRST	R/W	GPIOG Reset 0: No effect 1: Reset
7	PHRST	R/W	GPIOH Reset 0: No effect 1: Reset
11:8	Reserved		
12	CRCRST	R/W	CRC Reset 0: No effect 1: Reset
20:13	Reserved		
21	DMA1RST	R/W	DMA1 Reset 0: No effect 1: Reset
22	DMA2RST	R/W	DMA2 Reset 0: No effect 1: Reset ADC
24:23	Reserved		
25	ETHRST	R/W	ETH Reset 0: No effect 1: Reset
28:26	Reserved		
29	OTGHS1RST	R/W	OTGHS1 Reset 0: No effect 1: Reset
31:30	Reserved		

6.5.6 AHB2 peripheral reset register (RCM_AHB2RST)

Offset address: 0x14

Reset value: 0x0000 0000

Access: Access in the form of word, half word and byte, without wait cycle.

Field	Name	R/W	Description
0	DCIRST	R/W	DCI Reset 0: No effect 1: Reset
1	FPURST	R/W	FPU Reset 0: No effect 1: Reset
5:2	Reserved		
6	RNGRST	R/W	RNG Reset 0: No effect 1: Reset

Field	Name	R/W	Description
7	OTGFSRST	R/W	OTG_FS Reset 0: No effect 1: Reset
31:8	Reserved		

6.5.7 AHB3 peripheral reset register (RCM_AHB3RST)

Offset address: 0x18

Reset value: 0x0000 0000

Access: Access in the form of word, half word and byte, without wait cycle.

Field	Name	R/W	Description
0	EMMCRST	R/W	EMMC Reset 0: No effect 1: Reset
31:1	Reserved		

6.5.8 APB1 peripheral reset register (RCM_APB1RST)

Offset address: 0x20

Reset value: 0x0000 0000

Access: Access in the form of word, half word and byte, without wait cycle.

All bits can be reset or cleared by software.

Field	Name	R/W	Description
0	TMR2RST	R/W	TMR2 Reset 0: No effect 1: Reset
1	TMR3RST	R/W	TMR3 Reset 0: No effect 1: Reset
2	TMR4RST	R/W	TMR4 Reset 0: No effect 1: Reset
3	TMR5RST	R/W	TMR5 Reset 0: No effect 1: Reset
4	TMR6RST	R/W	TMR6 Reset 0: No effect 1: Reset
5	TMR7RST	R/W	TMR7 Reset 0: No effect 1: Reset
6	TMR12RST	R/W	TMR12 Reset 0: No effect 1: Reset

Field	Name	R/W	Description
7	TMR13RST	R/W	TMR13 Reset 0: No effect 1: Reset
8	TMR14RST	R/W	TMR14 Reset 0: No effect 1: Reset

13	Reserved		
14	SYSCFGEN	R/W	SYSCFG Module Clock Enable 0: Disable 1: Enable
15	Reserved		
16	TMR9EN	R/W	TMR9 Clock Enable 0: Disable 1: Enable
17	TMR10EN	R/W	TMR10 Clock Enable 0: Disable 1: Enable
18	TMR11EN	R/W	TMR11 Clock Enable 0: Disable 1: Enable
31:19	Reserved		

6.5.15 AHB1 peripheral clock enable register in low-power mode (RCM_LPAHB1CLKEN)

Offset address: 0x50

Reset value: 0x7E67 91FF

Access: Access in the form of word, half word and byte, without wait cycle.

The function of this register is to enable the peripheral clock of AHB1 in low-power (sleep) mode.

Field	Name	R/W	Description
0	PAEN	R/W	GPIOA Clock Enable 0: Disable 1: Enable
1	PBEN	R/W	GPIOB Clock Enable 0: Disable 1: Enable
2	PCEN	R/W	GPIOC Clock Enable 0: Disable 1: Enable

31	Reserved		

6.5.16 AHB2 peripheral clock enable register in low-power mode (RCM_LPAHB2CLKEN)

Offset address: 0x54

Reset value: 0x0000 00F1

Access: Access in the form of word, half word and byte, without wait cycle.

The function of this register is to enable the peripheral clock of AHB2 in low-power (sleep) mode.

Field	Name	R/W	Description
0	DCIEN	R/W	DCI Clock Enable 0: Disable 1: Enable
1	FPUEN	R/W	FPU Clock Enable 0: Disable 1: Enable

Field	Name	R/W	Description
5:2	Reserved

31:8	Reserved		

6.5.17 AHB3 peripheral clock enable register in low-power mode (RCM_LPAHB3CLKEN)

Offset address: 0x58

Reset value: 0x0000 0001

Access: Access in the form of word, half word and byte, without wait cycle.

The function of this register is to enable the peripheral clock of AHB3 in low-power (sleep) mode.

Field	Name	R/W	Description
0	EMMCEN	R/W	EMMC Clock Enable 0: Disable 1: Enable
31:1	Reserved		

6.5.18 APB1 peripheral clock enable register in low-power mode (RCM_LPAPB1CLKEN)

Offset address: 0x60

Reset value: 0x36FE C9FF

Access: Access in the form of word, half word and byte, without wait cycle.

All bits can be reset or cleared by software.

The function of this register is to enable the peripheral clock of APB1 in low-power (sleep) mode.

Field	Name	R/W	Description
0	TMR2EN	R/W	TMR2 Clock Enable 0: Disable 1: Enable

6.5.20 Backup domain control register (RCM_BDCTRL)

Offset address: 0x70

Reset value: 0x0000 0000, which can be reset effectively only by RTC domain

Access: Access in the form of word, half word and byte, with 0 to 3 wait cycles

When the register is accessed continuously, the waiting state will be inserted.

Note: Only when BPWEN bit in PMU_CTRL is set to 1, can LSEEN, LSEBCFG, RTCSRCSEL and RTCCLKEN be changed.

Field	Name	R/W	Description
0	LSEEN	R/W	Low-Speed External Oscillator Enable 0: Disable 1: Enable
1	LSERDYFLG	R	Low-Speed External Clock Ready Flag When LSECLK is stable, this bit is set to 1 by hardware, and when it is unstable, it is cleared by hardware. 0: Not ready 1. Ready
2	LSEBCFG	R/W	Low-Speed External Clock Bypass Mode Configure Bypass mode refers to the mode in which external clock is used as the LSECLK clock source; otherwise the resonator is used as the LSECLK clock source. 0: Non-bypass mode 1: Bypass mode
7:3	Reserved		
9:8	RTC SRCSEL	R/W	RTC Clock Source Select First set the RTCRST bit to reset the RTC domain, and then select the RTC clock source. It is impossible to directly configure the register to modify. 00: No clock 01: LSECLK is used as RTC clock 10: LSICLK is used as RTC clock 11: HSECLK is used as RTC clock after frequency division (the frequency division factor is determined by RTCPSC bit of RCM_CFG register)
14:10	Reserved		
15	RTCCLKEN	R/W	RTC Clock Enable 0: Disable 1: Enable
16	BDRST	R/W	Reset the backup domain software (Backup Domain Software Reset) Set to 1 or cleared by software 0: Reset is not activated 1: Reset the backup domain (only affect LSECLK oscillator, RTC real-time clock and register RCM_BDCTRL)
31:17	Reserved		

6.5.21 Clock control/State register (RCM_CSTS)

Offset address: 0x74

Reset value: 0x0E00 0000, except reset flag, all are cleared by system reset, and reset flag can only be cleared by power reset.

Access: Access in the form of word, half word and byte, with 0 to 3 wait cycles.

When the register is accessed continuously, the waiting state will be inserted.

Field	Name	R/W	Description
0	LSIEN	R/W	Low-Speed Internal Oscillator Enable Set to 1 or cleared by software. 0: Disable 1: Enable
1	LSIRDYFLG	R	Low-Speed Internal Oscillator Ready Flag When LSICLK is stable, this bit is set to 1 by hardware, and when it is unstable, it is cleared by hardware. 0: Not ready 1: Ready
23:2	Reserved		
24	RSTFLGCLR	RT_W	Reset Flag Clear The reset flag is set or cleared by software, including RSTFLGCLR. 0: Disable 1: Clear the reset flag
25	BORRSTFLG	R	BOR flag It is set by hardware when brownout reset occurs; otherwise it is cleared by setting RSTFLGCLR bit. 0: Reset does did not occur 1: Reset occurred
26	PINRSTFLG	R	PIN Reset Flag It is set by hardware when pin reset occurs; otherwise it is cleared by setting RSTFLGCLR. 0: Reset does did not occur 1: Reset occurred
27	PODRSTFLG	R	POR/PDR Reset Flag Set to 1 by hardware; cleared by software by writing RSTFLGCLR bit. 0: No power-on/power-down reset occurs 1: Power-on/power-down reset occurs
28	SWRSTFLG	R	Software Reset Flag Set to 1 by hardware; cleared by software by writing RSTFLGCLR bit. 0: Reset does did not occur 1: Reset occurred
29	IWDTRSTFLG	R	Independent Watchdog Reset Flag When independent watchdog reset occurs in V _{DD} area, it is set to 1 by hardware and cleared by software by writing RSTFLGCLR bit. 0: Reset does did not occur 1: Reset occurred
30	WWDTRSTFLG	R	Window Watchdog Reset Flag When window watchdog is reset, it is set to 1 by hardware and cleared by software by writing RSTFLGCLR bit. 0: Reset does did not occur 1: Reset occurred

Field	Name	R/W	Description
31	LPWRRSTFLG	R	Low Power Reset Flag When low-power management is reset, it is set to 1 by hardware and cleared by software by writing RSTFLGCLR bit. 0: Reset does did not occur 1: Reset occurred

6.5.22 Spread spectrum clock configuration register (RCM_SSCCFG)

Offset address: 0x80

Reset value: 0x0000 0000

Access: Access in the form of word, half word and byte, with 0 to 3 wait cycles.

Because the spread spectrum clock only acts on PLL1, this register can be written only when PLL1 is not enabled to configure the spread spectrum clock.

Field	Name	R/W	Description
12:0	MODPCFG	R/W	Modulation Period Configure Set to 1 or cleared by software. Configure the input of modulation period.
27:13	STEP	R/W	Incrementation Step Set to 1 or cleared by software. Configure the input of modulation amplitude.
29:28	Reserved		
30	SSSEL	R/W	Spread Spectrum Select It is set or cleared by software. 0: Center spread 1: Downward spread
31	SSEN	R/W	Spread Spectrum Enable Set to 1 or cleared by software. 0: Disable 1: Enable

6.5.23 PLL2 configuration register (RCM_PLL2CFG)

Offset address: 0x84

Reset value: 0x2000 3000

Access in the form of word, half word and byte, without wait cycle.

The register is used to configure various parameters so as to output different clock signals.

$$f_{(VCO\ clock)} = f_{(PLL2\ clock\ input)} \times (PLL2A/PLL2B)$$

$$f_{(PLL2\ clock\ output)} = f_{(VCO\ clock)} / PLL2C$$

Field	Name	R/W	Description
5:0	Reserved		
14:6	PLL2A	R/W	PLL Multiplication Factor It is used to calculate VCO frequency. The calculation formula is $f_{(VCO\ output)} = f_{(VCO\ input)} \times PLL2A$, and the formula is established only when PLL2A is 50~432. 000000000: PLL2A=0 (error)

Field	Name	R/W	Description
			000000001: PLL2A=1 (error) 000110010: PLL2A=50 001100011: PLL2A=99 001100100: PLL2A=100 110110000: PLL2A=432 110110001: PLL2A=433 (error) 111111111: PLL2A=511 (error)
27:15	Reserved		
30:28	PLL2C	R/W	Division Factor This bit can be set or cleared by software, and this variable can be controlled to change the clock frequency provided to I2S. This bit can be set only when PLL2 is disabled. Since I2S can only work at a frequency not greater than 192MHz, the range of PLL2C value shall be 2~7. 000: PLL2C=0 (wrong configuration) 001: PLL2C=1 (wrong configuration) 010: PLL2C=2 111: PLL2C=7
31	Reserved		

7 Power management unit (PMU)

7.1 Full name and abbreviation description of terms

Table 34 Full name and abbreviation description of terms

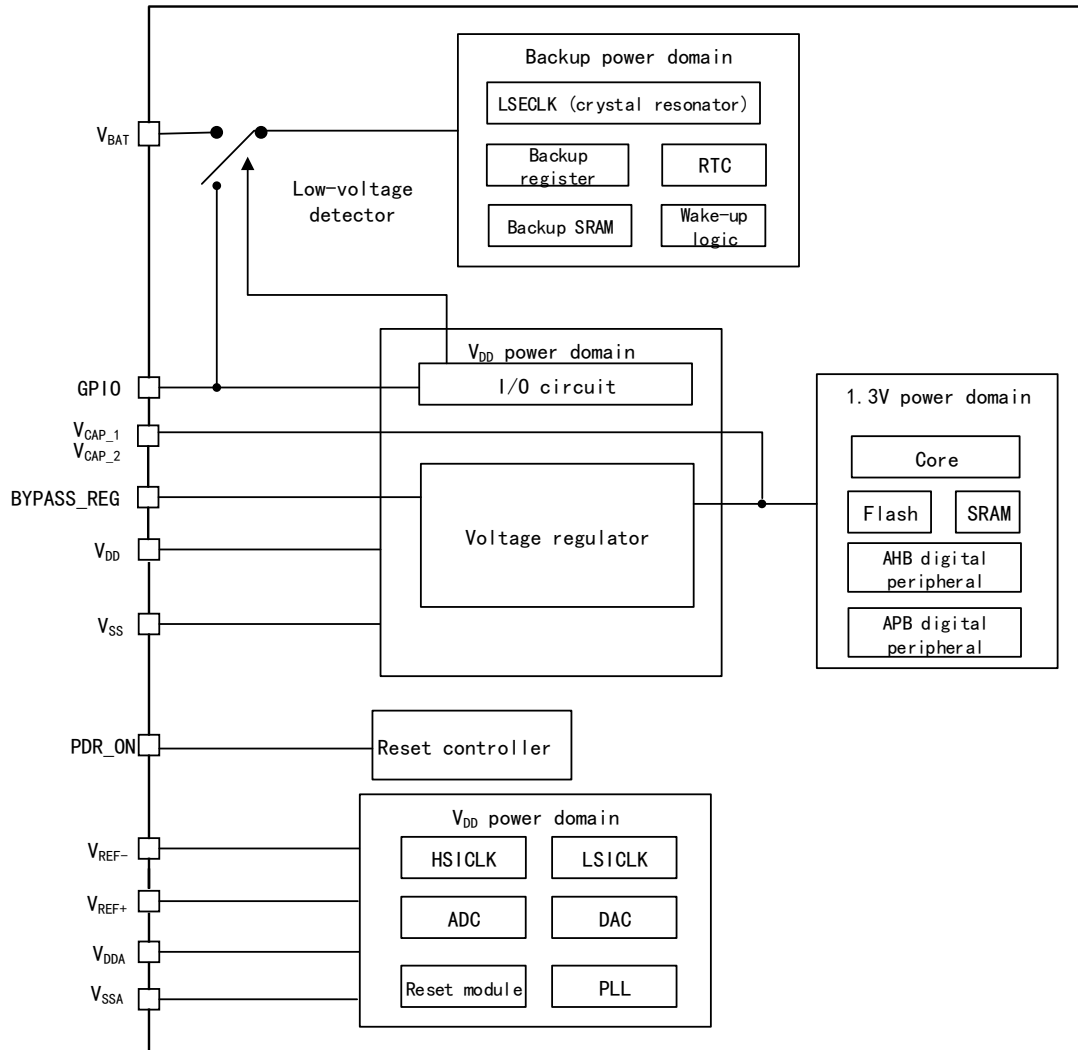

Full name in English	English abbreviation
Power Management Unit	PMU
Power On Reset	POR
Power Down Reset	PDR
Brown-out Reset	BOR
Power Voltage Detector	PVD

7.2 Introduction

The power supply is the basis for stable operation of a system. The working voltage is 1.8~3.6V. It can provide 1.3V power supply through the built-in voltage regulator. If the main power V_{DD} is powered down, it can supply power to the backup power supply area through V_{BAT} .

7.3 Structure block diagram

Figure 35 Power Supply Structure Block Diagram

7.4 Functional description

7.4.1 Power domain

The power domain of the product includes: V_{DD} power domain, V_{DDA} power domain, 1.3V power domain, and backup power domain.

7.4.1.1 V_{DD} power domain

Supply power through V_{DD}/V_{SS} pin to the voltage regulator and I/O.

Voltage regulator

Power can be supplied to 1.3V power domain in the following operating modes:

- Normal mode: In this mode, 1.3V power supply area operates at full power, and the level of the output voltage can be selected through VOSSEL bit of the register PMU_CTRL.
- Stop mode: In this mode, 1.3V power supply area works in low-power state, all clocks are off, peripherals stop working and the set voltage output level remains unchanged.
- Standby mode: In this mode, the 1.3V power supply area stops power supply, and except for the standby circuit, the content of register and SRAM will be lost

7.4.1.2 V_{DDA} power domain

Power the ADC, DAC, HSICLK, LSICLK, PLL and reset module through V_{DDA}/V_{SSA} and V_{REF+}/V_{REF-} pins.

Independent ADC power supply and reference voltage

Independent ADC power supply can improve conversion accuracy, and the specific power pins are as follows:

- V_{DDA}: Power pin of ADC
- V_{SSA}: Independent power ground pin
- V_{REF+}/V_{REF-}: ADC reference voltage pin

7.4.1.3 1.3V power domain

The core, Flash, SRAM and digital peripherals are powered by voltage regulator.

7.4.1.4 Backup power domain

When V_{DD} exists, the backup power supply area is powered by V_{DD}. When V_{DD} is powered down, the backup power supply area is powered by V_{BAT}, which is used to save the content of backup register and maintain RTC function. Power the LSECLK crystal oscillator, RTC, backup register, backup SRAM, PC13, PC14, PC15 and wake-up logics.

7.4.2 Power Management

7.4.2.1 Power-on/power-down reset (POR and PDR)

When the V_{DD}/V_{DDA} is detected to be lower than the threshold voltage V_{POR} and V_{PDR}, the chip will automatically maintain the reset state. The waveform diagrams of power-on reset and power-down reset are as follows. For POR, PDR, hysteresis voltage and hysteresis time, please refer to the "Datasheet".

Figure 8 Power-on Reset and Power-down Reset Oscillogram

7.4.2.2 Brownout reset (BOR)

When it is detected that V_{DD}/V_{DDA} is lower than the threshold voltage V_{BOR} , the chip will automatically remain in reset state, and V_{BOR} can be configured through option byte. The followings are 4 thresholds of V_{BOR} :

- V_{BOR0} : BOR is turned off, and the voltage range is 1.80~2.10V
- V_{BOR1} : BOR level is 1, and the voltage range is 2.10~2.40V
- V_{BOR2} : BOR level is 2, and the voltage range is 2.40~2.70V
- V_{BOR3} : BOR level is 3, and the voltage range is 2.70~3.60V

Figure 9 BOR Threshold Oscillogram

7.4.2.3 Power voltage detector (PVD)

A threshold can be set for PVD to monitor whether V_{DD}/V_{DDA} is higher or lower than the threshold. If interrupt is enabled, the interrupt can be triggered to process V_{DD}/V_{DDA} exceeding the threshold in advance. The usage of PVD is as follows:

- (1) Set the PVDEN bit of the configuration register PMU_CTRL to 1 to enable PVD
- (2) Select the voltage threshold of PVD for the PLSEL[2:0] bit of the configuration register PMU_CTRL
- (3) The PVDOFLG bit of the configuration register PMU_CSTS indicates the value of V_{DD} is higher or lower than the threshold of PVD
- (4) When it is detected that V_{DD}/V_{DDA} is lower or higher than the threshold of PVD, PVD interrupt will be generated

The threshold waveform of PVD is shown below. Please see "Datasheet" for PVD threshold and hysteresis voltage.

Figure 10 PVD Threshold Oscillogram

7.4.3 Power consumption control

7.4.3.1 Reduce the power consumption in low-power mode

There are three low-power modes: sleep mode, stop mode and standby mode. The power consumption is reduced by closing the core and clock source and setting the voltage regulator.

The power consumption, wake-up start time, wake-up mode and data storage of each low-power mode are different; the lower the power consumption is, the longer the wake-up time is, the less the wake-up mode is, the less the data saved are after wake-up; users can choose the most appropriate low-power mode according to their needs. The following table shows the difference among three low-power modes.

Table 36 Difference among "Sleep Mode, Stop Mode and Standby Mode"

Mode	Description	Entry mode	Wake-up mode	Voltage regulator	Effect on 1.3V area clock	Effect on V _{DD} area clock
Sleep	Arm [®] Cortex [®] -M4F core	Call WFI instruction	Any interrupt	Open	Only the core clock	None

Mode	Description	Entry mode	Wake-up mode	Voltage regulator	Effect on 1.3V area clock	Effect on V _{DD} area clock
	stops, and all peripherals including the core peripheral are still working	Call WFE instruction	Wake-up event	Open	is turned off and it has no effect on other clocks and ADC clocks	None
Stop	All clocks have stopped	PDDSCFG and LPDSCFG bits +SLEEPDEEP bit +WFI or WFE	Any external interrupt	Turn on or be in low-power mode	Close clocks of all 1.3V areas	The oscillator of HSICLK and HSECLK is turned off
Standby	1.3V power off	PDDSCFG bit +SLEEPDEEP bit +WFI or WFE	Rising edge of WKUP pin, RTC alarm event, RTC wake-up event, RTC timestamp event, RTC tamper event, external reset on NRST pin, and IWDG reset	Off		

Sleep mode

The characteristics of sleep mode are shown in the table below

Table 37 Characteristics of Sleep Mode

Characteristics	Description
Enter	Enter the sleep mode immediately by executing WFI or WFE instructions; When SLEEPONEINT is set to 0 and WFI or WFE instruction is executed, the system will enter the sleep mode immediately; when SLEEPONEINT is set to 1, the system will exit the interrupt program and then enter the sleep mode immediately.
Wake-up	If WFI instruction is executed to enter the stop mode, wake up by any interrupt; If WFE instruction is executed to enter the stop mode, wake up through an event.
Sleep	The core stops working, all peripherals are still running, and the data in the core registers and memory before sleep are saved.
Wake-up delay	None

Characteristics	Description
After wake-up	If the system is woken up by interrupt, it will first enter the interrupt, then exit the interrupt, and then execute the program after WFI instruction. If the system is woken up by event, it will directly execute the program after WFE instruction.

Stop mode

The characteristics of stop mode are shown in the table below:

Table 38 Characteristics of Stop Mode

Characteristics	Description
Enter	SLEEPDEEP bit of the core register is set to 1, PDDSCFG bit of the register PMU_CTRL is set to 0, and when executing WFI or WFE instruction, the system will enter the stop mode immediately; When LPDSCFG bit of the register PMU_CTRL is set to 0, the voltage regulator is working in normal mode; when LPDSCFG bit of the register PMU_CTRL is set to 1, the voltage regulator is working in low-power mode.
Wake-up	If WFI instruction is executed to enter the sleep mode, wake up by any interrupt; If WFE instruction is executed to enter the sleep mode, wake up through an event.
Stop	The core will stop working, the peripheral will stop working, and the data in the core register and memory before stop will be saved.
Wake-up delay	HSICLK oscillator wake-up time + voltage regulator wake-up time from low-power mode.
After wake-up	If the system is woken up by interrupt, it will first enter the interrupt, then exit the interrupt, and then execute the program after WFI instruction. If the system is woken up by event, it will directly execute the program after WFE instruction.

Standby mode

The characteristics of standby mode are shown in the table below:

Table 39 Standby Mode

Characteristics	Description
Enter	SLEEPDEEP bit of the core register is set to 1, PDDSCFG bit of the register PMU_CTRL is set to 1, WUEFLG bit is set to 0 and when executing WFI or WFE instruction, the system will enter the standby mode immediately.
Wake-up	Wake up by rising edge of WKUP pin, RTC alarm, wake-up, tamper event or NRST pin external reset and IWDG reset.
Standby	The core will stop working, the peripheral will stop working, and the data in the core register and memory will be lost.
Wake-up delay	Chip reset time.
After wake-up	The program starts executing from the beginning.

7.4.3.2 Reduce the power consumption in run mode

In the run mode, the power consumption can be reduced by reducing the system clock, closing or reducing the peripheral clock on the APB/AHB bus.

7.4.3.3 RTC multiplexing function is waken up from low-power mode

RTC multiplexing functions include RTC alarm, RTC wake-up event, RTC tamper event and RTC timestamp event. These functions can wake up MCU from stop mode or standby mode, and RTC provides programmable time base to wake up the devices regularly from stop or standby mode.

7.5 Register address mapping

Table 40 PMU Register Address Mapping

Register name	Description	Offset address
PMU_CTRL	Power control register	0x00
PMU_CSTS	Power control/state register	0x04

7.6 Register functional description

7.6.1 Power control register (PMU_CTRL)

Offset address: 0x00

Reset value: 0x0000 4000 (cleared when waking up from standby mode)

Field	Name	R/W	Description
0	LPDSCFG	R/W	Low Power Deepsleep Configure Configure the working state of the voltage regulator in stop mode. 0: Enable 1: Low-power mode
1	PDDSCFG	R/W	Power Down Deep Sleep Configure When the CPU enters deep sleep, configure the voltage regulator state in standby and stop modes. 0: The voltage regulator is controlled by LPDSCFG bit when entering the stop mode 1: Enter standby mode
2	WUFLGCLR	RC_W1	Wakeup Flag Clear 0: Invalid 1: Clear the wake-up flag after 2 system clock cycles by writing 1
3	SBFLGCLR	RC_W1	Standby Flag Clear 0: Invalid 1: Write 1 to clear the standby flag
4	PVDEN	R/W	Power Voltage Detector Enable 0: Disable 1: Enable
7:5	PLSEL	R/W	PVD Level Select 000: 2.0V 001: 2.1V 010: 2.3V 011: 2.5V 100: 2.6V

Field	Name	R/W	Description
			101: 2.7V 110: 2.8V 111: 2.9V Note: See "Datasheet" for detailed instructions
8	BPWEN	R/W	Backup Domain Write Access Enable Backup area refers to RTC and backup register; write access is disabled after reset, and is allowed after writing 1. 0: Write is disabled 1: Write is enabled
9	FPDSM	R/W	Flash power-down in Stop mode 0: Flash does not power down when entering the stop mode 1: Flash powers down when entering the stop mode
13:10	Reserved		
14	VOSSSEL	R/W	Regulator Voltage Scaling Output Selection 0: Level 2 mode 1: Level 1 mode
31:15	Reserved		

7.6.2 Power supply control/state register (PMU_CSTS)

Offset address: 0x04

Reset value: 0x0000 0000 (not cleared when waking up from standby mode)

Compared with the standard APB read, it requires extra APB cycle to read this register

Field	Name	R/W	Description
0	WUEFLG	R	Wakeup Event Flag This bit is set by hardware, indicating whether wake-up event or RTC alarm wake-up event, RTC tamper event, RTC timestamp or RTC wake-up event occurs on WKUP pin. 0: Not occur 1: Occurred Note: Enable the WKUP pin, and an event will be detected when the WKUP pin is at high level.
1	SBFLG	R	Standby Flag This bit is set to 1 by hardware, and can only be cleared by POR/PDR (power-on/power-down reset) or by setting the SBFLGCLR bit of the power supply control register (PMU_CTRL). 0: Not enter the standby mode 1: Have entered the standby mode
2	PVDOFLG	R	PVD Output Flag Indicate whether V_{DD}/V_{DDA} is higher than the PVD threshold selected by PLSEL[2:0] This bit is valid only when PVD is enabled by PVDEN BIT. 0: V_{DD}/V_{DDA} higher than PVD threshold 1: V_{DD}/V_{DDA} lower than PVD threshold Note: This bit is 0 after reset or when entering the standby mode (PVD stops work).

Field	Name	R/W	Description
3	BKPRFLG	R	Backup regulator ready Flag This bit is set to 1 by hardware, indicating whether the backup regulator is ready. 0: Not ready 1. Ready
7:4	Reserved		
8	WKUPCFG	R/W	WKUP Pin Configure When WKUP is used as a normal I/O, the event on WKUP pin cannot wake up the CPU in standby mode; it can wake up CPU only when it is not used as a normal I/O. 0: Configure normal I/O 1: Can wake MCU Note: Clear this bit in system reset
9	BKPREN	R/W	Backup Regulator Enable 0: Disable 1: Enable
13:10	Reserved		
14	VOSRFLG	R	Regulator Voltage Scaling Output Selection Ready Flag 0: Not ready 1. Ready
31:15	Reserved		

8 Nested vector interrupt controller (NVIC)

8.1 Full name and abbreviation description of terms

Table 41 Full name and abbreviation description of terms

Full name in English	English abbreviation
Non Maskable Interrupt	NMI

8.2 Introduction

The Cortex-M4F core in the product integrates nested vectored interrupt controller (NVIC), which is closely coupled with the core, and can handle exceptions and interrupts and power management control efficiently and with low delay. Please see *Cortex-M4 Technical Reference Manual* for more instructions about NVIC.

8.3 Main characteristics

- (1) 81 maskable interrupt channels (excluding 16 Arm® Cortex®-M4F interrupt lines)
- (2) 8 programmable priority levels (3-bit interrupt priority level could be used)
- (3) Low-delay exception and interrupt processing
- (4) Power management control
- (5) Realization of system control register

9 External Interrupt/Event Controller (EINT)

9.1 Introduction

The interrupts/events contain internal interrupt/event and external interrupt/event. In this manual, external interrupt refers to the interrupt/event caused by I/O pin input signal, which is EINTx in interrupt vector table; other interrupts are internal interrupts/events.

The events can be divided into hardware events and software events. Hardware events are generated by external/core hardware signals, while software events are generated by instructions.

Interrupts need to go through the interrupt handler function to realize the work to be processed, while events do not need to go through interrupt handler function, and the preset work can be triggered by hardware. The external events output pulse through events such as GPIO, while the internal events trigger another TMR to work, for example, through update event of one TMR.

9.2 Main Characteristics

- (1) Support 23 event/interrupt requests
- (2) Can be configured independently as the line of external/internal event request
- (3) Each event/interrupt line can be masked independently
- (4) Each external event/interrupt line can be triggered independently
- (5) Each external interrupt line has dedicated state bit
- (6) Detects external signals whose pulse width is lower than the APB2 clock width

9.3 Functional description

9.3.1 "External interrupt and event" classification and difference points

"External interrupt and event" can be classified into external hardware interrupt, external hardware event, external software event and external software interrupt according to trigger source, configuration and execution process. The difference points are shown in the table below:

Table 43 "External Interrupt and Event" Classification and Difference Points

Name	Trigger source	Configuration and execution process
External hardware interrupt	External signal	(1) Set the trigger mode, allow the interrupt request, and enable corresponding peripheral interrupt line (enable in NVIC); (2) When an edge consistent with the configuration is generated on the external interrupt line, an interrupt request will be generated, and the corresponding suspend bit will be set to 1. Write 1 to the corresponding bit of the pending register and the interrupt request will be cleared.
External hardware event	External signal	(1) Set the trigger mode and enable the event line; (2) When an edge consistent with the configuration is generated on the external event line, one event request pulse will be generated, and the corresponding pending bit will not be set to 1.
External software request	Software interrupt register/transmission event (SEV) instruction	(1) Enable the event line; (2) Write 1 to the software interrupt event register of the corresponding event line to generate an event request pulse, and the corresponding pending bit will not be set to 1.
External software interrupt	Software interrupt register	(1) Allow interrupt request, and enable the corresponding peripheral interrupt line (enable in NVIC); (2) Write 1 to the software interrupt event register of the corresponding interrupt line to generate an interrupt request, the corresponding pending bit will be set to 1; write 1 to the corresponding bit of the pending register and the interrupt request will be cleared.

9.3.2 Core wake-up

Using WFI and WFE instructions can make the core stop working. When WFI instruction is used, any interrupt can wake up the core; when WFE instruction is used, the core can be awakened up by event.

When interrupt is used for wake-up, the interrupt handler function will be triggered, and normal interrupt configuration can wake up the core. When an event is used to wake up the core, the interrupt handler function will not be triggered, which will reduce the wake-up time, and the configuration method is:

- (1) It can trigger an internal interrupt (internal hardware event) but cannot trigger the interrupt handler function for wake-up
 - It can enable an internal interrupt in the peripheral, but cannot enable the corresponding interrupt in NVIC to avoid triggering the interrupt handler function
 - Enable SEVONPEND bit in the system controller of the core, and execute WFE instruction to make the core enter sleep mode

- Generate an interrupt to wake up the core; when the core recovers from WFE, it is required to clear the pending bit of corresponding peripheral interrupt and the pending bit of peripheral NVIC interrupt channel (clear the pending register in the NVIC interrupt)
- (2) Wake up through EINT line events (external hardware event)
- Configure EINT line as the event mode
 - Execute WFE instruction to make the core enter the sleep mode
 - Generate an interrupt to wake up the core; when the CPU recovers from WFE, since the pending bit of corresponding event line is not set, it is unnecessary to clear the interrupt pending bit of corresponding peripheral or the NVIC interrupt channel pending bit

9.3.2.1 Event wake-up

It can trigger an internal interrupt (internal hardware event) but cannot trigger the interrupt handler function for wake-up

- (1) Enable an internal interrupt in the peripheral, but do not enable the corresponding interrupt in NVIC to avoid triggering the interrupt handler function;
- (2) Enable SEVONPEND bit in the system controller of the core, and execute WFE instruction to make the core enter sleep mode;
- (3) Generate an interrupt to wake up the core; when the core recovers from WFE, it is required to clear the pending bit of corresponding peripheral interrupt and the pending bit of peripheral NVIC interrupt channel (clear the pending register in the NVIC interrupt).

Wake up through EINT line events (external hardware event)

- (1) Configure EINT line as the event mode;
- (2) Execute WFE instruction to make the core enter the sleep mode;
- (3) Generate an interrupt to wake up the core; when the CPU recovers from WFE, since the pending bit of corresponding event line is not set, it is unnecessary to clear the interrupt pending bit of corresponding peripheral or the NVIC interrupt channel pending bit.

9.3.3 External Interrupt and Event Line Mapping

9.4 Register address mapping

Table 45 EINT Register Address Mapping

Register name	Description	Offset address
EINT_IMASK	Interrupt mask register	0x00
EINT_EMASK	Event mask register	0x04
EINT_RTEN	Enable the rising edge to trigger the register	0x08
EINT_FTEN	Enable the falling edge to trigger the register	0x0C
EINT_SWINTE	Software interrupt event register	0x10
EINT_IPEND	Interrupt pending register	0x14

9.5 Register functional description

9.5.1 Interrupt mask register (EINT_IMASK)

Offset address: 0x00

Reset value: 0x0000 0000

Field	Name	R/W	Description
22:0	IMASKx	R/W	Interrupt Request Mask on Line x (x=0~22) 0: Mask 1: Open
31:23	Reserved		

9.5.2 Event mask register (EINT_EMASK)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
22:0	EMASKx	R/W	Event Request Mask on Line x (x=0~22) 0: Mask 1: Open
31:23	Reserved		

9.5.3 Enable the rising edge trigger register (EINT_RTEN)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
22:0	RTENx	R/W	Rising Trigger Event and Interrupt Enable of Line x (x=0~22) 0: Disable 1: Enable
31:23	Reserved		

Note: Since the external wake-up lines are edge triggered, there should be no burr signal on these lines; when writing EINT_RTEN register, if the rising edge signal is on the external interrupt line, it will not be recognized and the set pending bit will not be set; in the same interrupt line, the rising edge trigger and falling edge trigger can be set at the same time.

9.5.4 Enable the falling edge trigger register (EINT_FTEN)

Offset address: 0x0C

Reset value: 0x0000 0000

Field	Name	R/W	Description
22:0	FTENx	R/W	Falling Trigger Event and Interrupt Enable of Line x (x=0~22) 0: Disable 1: Enable
31:23	Reserved		

Note: Since the external wake-up lines are edge triggered, there should be no burr signal on these lines; when writing EINT_FTEN register, if the rising edge signal is on the external interrupt line, it will not be recognized and the set pending bit will not be set; in the same interrupt line, the rising edge trigger and falling edge trigger can be set at the same time.

9.5.5 Software interrupt event register (EINT_SWINTE)

Offset address: 0x10

Reset value: 0x0000 0000

Field	Name	R/W	Description
22:0	SWINTE _x	R/W	<p>Software Interrupt Event on Line x (x=0~22)</p> <p>This bit can be set to 1 by software, and be cleared by writing 1 to the corresponding bit of EINT_IPEND.</p> <p>When this bit is 0, the pending bit of EINT_IPEND can be set by writing 1. If EINT_IMASK (EINT_EMASK) is set to open the interrupt (event) request, an interrupt (event) will be generated.</p> <p>0: No effect 1: Software generates an interrupt (event)</p>
31:23	Reserved		

9.5.6 Interrupt pending register (EINT_IPEND)

Offset address: 0x14

Reset value: 0xXXXX XXXX

Field	Name	R/W	Description
22:0	IPEND _x	RC_W1	<p>Interrupt Pending Occur of Line x Flag (x=0~22)</p> <p>When a trigger request on the corresponding edge of EINT occurs on an external interrupt line, it will be set to 1 by hardware; it can be cleared by changing the polarity of the edge detection or by writing 1 to this bit.</p>
31:23	Reserved		

10 Direct memory access (DMA)

10.1 Introduction

DMA (Direct Memory Access) can realize high-speed data transmission between peripheral devices and memory or between memory and memory without CPU intervention, thus saving CPU resources for other operations.

The product has two DMA controllers, with 16 data streams. Each data stream corresponds to 8 channels, but each data stream can only use 1 channel at the same time. Each data stream can set priority, and the arbiter can coordinate the priority of corresponding DMA requests of each data stream according to the priority of the data stream.

10.2 Main characteristics

- (1) Two DMA; each DMA has 8 data streams, and each data stream has 8 channels
- (2) Dual AHB main interfaces; one is memory interface, and the other is peripheral interface
- (3) There are three data transmission modes: peripheral to memory, memory to peripheral, memory to memory
- (4) Each data stream has a special hardware DMA request for connection
- (5) Support software priority and hardware priority when multiple requests occur at the same time
- (6) Each data stream has 5 event flags and independent interrupts
- (7) Support circular transmission mode
- (8) The number of data transmission is programmable, up to 65535
- (9) The configurable source and target transmission width is byte, half word or word
- (10) Support source and target incremental modes
- (11) The configurable burst increment size is single time, 4, 8 or 16 ticks

10.3 Functional description

10.3.1 DMA request

If the peripheral or memory needs to use DMA to transmit data, it is required to first transmit DMA request and wait for DMA approval before data transmission.

Two DMA have 16 data streams in total. Each data stream is connected with different peripheral channels, and each data stream has five event flags (DMA half transmission, DMA transmission completion, DMA transmission error, DMA FIFO error, and direct mode error). The logic of the five event flags may become a separate interrupt request, and they all support software trigger.

When multiple peripherals request the same data stream, it is required to configure the corresponding register to turn on or off the request of each peripheral, so as to ensure that one data stream can only turn on one peripheral request.

Table 46 DMA1 Request Mapping Table

Peripheral request	Data stream 0	Data stream 1	Data stream 2	Data stream 3	Data stream 4	Data stream 5	Data stream 6	Data stream 7
Channel 0	SPI3_RX	-	SPI3_RX	SPI2_RX	SPI2_TX	SPI3_TX	-	SPI3_TX
Channel 1	I2C1_RX	-	TMR7_UP	-	TMR7_UP	I2C1_RX	I2C1_TX	I2C1_TX
Channel 2	TMR4_CH1	-	I2S3_EXT_RX	TMR4_CH2	I2S2_EXT_TX	I2S3_EXT_TX	TMR4_UP	TMR4_CH3
Channel 3	I2S3_EXT_RX	TMR2_UP TMR2_CH3	I2C3_RX	I2S2_EXT_RX	I2C3_TX	TMR2_CH1	TMR2_CH2 TMR2_CH4	TMR2_UP TMR2_CH4
Channel 4	UART5_RX	USART3_RX	UART4_RX	USART3_TX	UART4_TX	USART2_RX	USART2_TX	UART5_TX
Channel 5	-	-	TMR3_CH4 TMR3_UP	-	TMR3_CH1 TMR3_TRIG	TMR3_CH2	-	TMR3_CH3

Channel 7	-	TMR6_UP	I2C2_RX	I2C2_RX	USART3_TX	DAC1	DAC2	I2C2_TX

Table 47 DMA2 Request Mapping Table

Peripheral request	Data stream 0	Data stream 1	Data stream 2	Data stream 3	Data stream 4	Data stream 5	Data stream 6	Data stream 7
Channel 0	ADC1	-	TMR8_CH1 TMR8_CH2 TMR8_CH3	-	ADC1	-	TMR1_CH1 TMR1_CH2 TMR1_CH3	-
Channel 1	-	DCI	ADC2	ADC2	-	-	-	DCI
Channel 2	ADC3	ADC3	-	-	-	-	-	-
Channel 3	SPI1_RX	-	SPI1_RX	SPI1_TX	-	SPI1_TX	-	-
Channel 4	-	-	USART1_RX	SDIO	-	USART1_RX	SDIO	USART1_TX
Channel 5	-	USART6_RX	USART6_RX	-	-	-	USART6_TX	USART6_TX
Channel 6	TMR1_TRIG	TMR1_CH1	TMR1_CH2	TMR1_CH1	TMR1_CH4 TMR1_TRIG TMR1_COM	TMR1_UP	TMR1_CH3	-
Channel 7	-	TMR8_UP	TMR8_CH1	TMR8_CH2	TMR8_CH3	-	-	TMR8_CH4 TMR8_TRIG TMR8_COM

10.3.2 Arbitrator

When multiple DMA channel requests occur, an arbiter is needed to manage the response sequence. Management is divided into two stages: the first stage is software stage, which is divided into the highest, high, medium and low priority; the second stage is hardware stage, and under the condition of the same software priority, the lower the data stream number is, the higher the priority is.

10.3.3 FIFO

FIFO is used to temporarily store data before the source data is transmitted to the destination address. Each data stream has an independent 4-word FIFO, and the FIFO threshold can be controlled by software to be 1/4, 1/2, 3/4 or full.

There are two DMA transmission modes. The first is direct mode, in which a single transmission will be started to the memory immediately after each peripheral requests. If DMA is configured to transmit data from the memory to the peripheral, DMA will store a data in FIFO, and once the peripheral triggers the DMA request, it will transmit the data. The direct mode requires the same data width configuration for the source and destination addresses, and does not support burst mode and memory-to-memory transmission mode. The second is FIFO mode, in which, FIFO threshold is configured first, and when the data storage reaches the threshold, FIFO content will be transmitted to the destination address; FIFO mode is applicable when the data width of source address and destination address is different, and it supports burst mode; FIFO can store the data first and output them as required.

10.3.4 Port

DMA controller transmits data between the memory and the peripherals through the memory port and the peripheral port. The memory port and peripheral port of DMA2 are connected to AHB matrix bus, and the memory and peripheral of DMA2 can access the internal Flash, internal SRAM, AHB1 peripheral, APB1 peripheral, APB2 peripheral, AHB2 peripheral and external memory; the memory port of DMA1 does not have the access right for AHB2 peripheral compared with DMA2, the peripheral port of DMA1 is only connected to APB1 peripheral, so DMA1 cannot realize memory-to-memory transmission.

10.3.5 DMA initialization parameter configuration

10.3.5.1 Transmission mode

DMA2 supports three transmission modes: peripheral-to-memory mode, memory-to-peripheral mode and memory-to-memory mode. DMA1 supports two transmission modes: peripheral-to-memory and memory-to-peripheral.

The transmission mode can be controlled through DIRCFG bit of DMA_SCFG register.

10.3.5.2 Increment mode

The increment mode of peripheral and memory is controlled through PERIM and MEMIM bits of DMA_SCFG register. When both bits are set to 1, it is configured as the increment mode and the increment is the value of PERSIZECFG and MENSIZECFG bits of DMA_SCFG register. The PERSIZECFG and MENSIZECFG bits are used to set the data size of peripheral and memory to byte, half word or word.

10.3.5.3 Single transmission and burst mode

Burst transmission refers to the high-speed transmission that increases the data volume transmitted each time at the transmission stage so as to improve the transmission speed. In the process of burst transmission, AHB bus will be occupied.

Single and burst transmissions can be controlled through the PBCFG and MBCFG bits of DMA_SCFG register, and it can be configured as single transmission, incremental burst transmission of 4 ticks, incremental burst transmission of 8 ticks and incremental burst transmission of 16 ticks. This increment is determined by the value of PERSIZECFG and MENSIZECFG bits. The burst mode can be enabled only when the increment mode is supported.

The burst mode shall be used in combination with FIFO, and the selected FIFO threshold shall be suitable for the burst size of memory, as shown in the table below.

Table 48 FIFO Threshold Configuration

MENSIZECFG	FIFO threshold	MBCFG=01	MBCFG=10	MBCFG=11
Byte	1/4	One-time burst of 4 ticks	Disable	Disable
	1/2	Two-time burst of 4 ticks	One-time burst of 8 ticks	
	3/4	Three-time burst of 4 ticks	Disable	
	Full	Four-time burst of 4 ticks	Two-time burst of 8 ticks	One-time burst of 16 ticks
Half word	1/4	Disable	Disable	Disable
	1/2	One-time burst of 4 ticks		
	3/4	Disable		
	Full	Two-time burst of 4 ticks	One-time burst of 8 ticks	
Word	1/4	Disable	Disable	

MENSIZECFG	FIFO threshold	MBCFG=01	MBCFG=10	MBCFG=11
	1/2			
	3/4			
	Full	One-time burst of 4 ticks		

10.3.5.4 Circular mode

The circular mode is used to process the circular buffer area and continuous data stream. The circular mode will automatically configure the number of data items as the initial value after the transmission ends, and continue the data transmission.

The circular mode can be controlled through CIRC MEN bit of DMA_SCFG register.

10.3.5.5 Double-buffer mode

Set DBM of DMA_SCFG register to 1 to turn on the double- buffer mode and automatically activate the circular mode. In the double-buffer mode, the DMA_M1ADDR register is activated, and when the corresponding memory area of the address pointer of DMA_M0ADDR register finishes transmission, the corresponding memory area of the address pointer of DMA_M1ADDR register will continue to transmit and be called circularly. When DMA accesses DMA_M1ADDR, CTARG bit of DMA_SCFG register will be set to 1 and can write or read data to DMA_M0ADDR register at the same time.

This mode does not support memory-to-memory transmission.

10.3.5.6 Stream controller

The stream controller can be configured as DMA or peripheral through PERFC bit of DMA_SCFG register.

When DMA is used as the stream controller, configure DMA_NDATA register before enabling data stream, and set the number of data items to be transmitted.

When the peripheral is used as the stream controller, the number of transmitted data items is unknown, and the hardware will force the value of DMA_NDATA register to 0xFFFF for execution. After the transmission is completed, the peripheral will transmit instructions to DMA through hardware, and then read the value of the register. The number of transmitted data=0xFFFF-DMA_NDATA.

When the peripheral is used as the stream controller, the circular mode is disabled. When the memory-to-memory mode is selected, the PERFC bit will be forced to be cleared to zero by the hardware, and only DMA can be selected as the stream controller.

10.3.6 Interrupt

Each data stream has five types of interrupt events: half transmission, transmission completion, transmission error, FIFO error and direct mode error.

Table 49 DMA Interrupt Request

Interrupt event	Event flag bit	Enable interrupt bit
Half transmission	HTXIFLGx	HTXIEN
Transmission completed	TXCIFLGx	TXCIEN
Transmission error	TXEIFLGx	TXEIEN
FIFO error	FEIFLGx	FEIEN
Direct mode error	DMEIFLGx	DMEIEN

10.4 DMA register address mapping

Table 50 DMA Register Address Mapping

Register name	Description	Offset address
DMA_LINTSTS	DMA low interrupt state register	0x00
DMA_HINTSTS	DMA high interrupt state register	0x04
DMA_LIFCLR	DMA low interrupt flag clear register	0x08
DMA_HIFCLR	DMA high interrupt flag clear register	0x0C
DMA_SCFG	DMA data stream x configuration register	0x10+0x18× (data stream number)
DMA_NDATA	DMA data stream x data item number register	0x14+0x18× (data stream number)
DMA_PADDR	DMA data stream x peripheral address register	0x18+0x18× (data stream number)
DMA_M0ADDR	DMA data stream x memory 0 address register	0x1C+0x18× (data stream number)
DMA_M1ADDR	DMA data stream x memory 1 address register	0x20+0x18× (data stream number)
DMA_FCTRL	DMA data stream x FIFO control register	0x24+0x18× (data stream number)

10.5 Register functional description

10.5.1 DMA low interrupt state register (DMA_LINTSTS)

Offset address: 0x00

Reset value: 0x0000 0000

Field	Name	R/W	Description
22、16、6、0	FEIFLGx	R	Stream x FIFO Error Interrupt Flag (x=0...3) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_LIFCLR register. 0: No FIFO error event 1: FIFO error event occurs
23、17、7、1	Reserved		
24、18、8、2	DMEIFLGx	R	Stream x Direct Mode Error Interrupt Flag (x=0...3) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_LIFCLR register. 0: No direct mode error 1: Direct mode error is generated
25、19、9、3	TXEIFLGx	R	Stream x Transfer Error Interrupt Flag (x=0...3) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_LIFCLR register. 0: No transmission error 1: Transmission error is generated
26、20、10、4	HTXIFLGx	R	Stream x Half Transfer Interrupt Flag (x=0...3) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_LIFCLR register. 0: No half-transmission event 1: Half-transmission event is generated
27、21、11、5	TXCIFLGx	R	Stream x Transfer Complete Interrupt Flag (x=0...3) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_LIFCLR register. 0: No transmission completion event 1: Transmission completion event is generated.
31:28、15:12	Reserved		

10.5.2 DMA high interrupt state register (DMA_HINTSTS)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
22、16、6、0	FEIFLGx	R	Stream x FIFO Error Interrupt Flag (x=4...7) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_HIFCLR register. 0: No FIFO error event 1: FIFO error event occurs
23、17、7、1	Reserved		
24、18、8、2	DMEIFLGx	R	Stream x Direct Mode Error Interrupt Flag (x=4...7) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_HIFCLR register. 0: No direct mode error 1: Direct mode error is generated

Field	Name	R/W	Description
25、19、9、3	TXEIFLGx	R	Stream x Transfer Error Interrupt Flag (x=4...7) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_HIFCLR register. 0: No transmission error 1: Transmission error is generated
26、20、10、4	HTXIFLGx	R	Stream x Half Transfer Interrupt Flag (x=4...7) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_HIFCLR register. 0: No half-transmission event 1: Half-transmission event is generated
27、21、11、5	TXCIFLGx	R	Stream x Transfer Complete Interrupt Flag (x=4...7) These bits are set to 1 by hardware; write 1 and set to 0 by software on the corresponding bit of DMA_HIFCLR register. 0: No transmission completion event 1: Transmission completion event is generated.
31:28、15:12	Reserved		

10.5.3 DMA low interrupt flag clear register (DMA_LIFCLR)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
22、16、6、0	CFEIFLGx	W	Stream x Clear FIFO Error Interrupt Flag (x=0...3) 0: Invalid 1: The corresponding FEIFLGx flag in DMA_LINTSTS register is set to 0
23、17、7、1	Reserved

11 Debug MCU (DBGMCU)

11.1 Full name and abbreviation description of terms

Table 51 Full name and abbreviation description of terms

Full name in English	English abbreviation
Frame Clock	FCLK
Serial Wire/JTAG Debug Port	SWJ-DP

11.2 Introduction

APM32A407 MCU series uses Arm® Cortex® -M4F core, and Arm® Cortex® -M4F core includes hardware debug module and supports complex debug operation. During debugging, the module can make the running core stop at breakpoint, and achieve the effect of querying the internal state of the core and the external state of the system, and after the query is completed, the core and peripheral operation can be restored to continue to execute the program.

Two debug interfaces are supported:

- Serial interface
- JTAG debug interface

Note: The hardware debug interface included in Arm® Cortex® -M4F core is subset of Arm CoreSight development tool set. Please refer to *Cortex®-M4F (Version r1p1) Technical Reference Manual (TRM)* and CoreSight development tool set (Version r1p0) TRM for more information about debug function of Arm® Cortex®-M4F core.

11.3 Main characteristics

- (1) Replace the core to access AHB bus matrix
- (2) Flexible debug pin assignment
- (3) MCU debug box (support low-power mode, control peripheral clock, etc.)

Figure 11 APM32A4xx Level and Arm® Cortex® -M4F Level Debugging Block Diagram

11.4 Functional description

11.4.1 Debug pin function configuration

- (1) Realize the on-line programming and debugging of the chip
- (2) Using KEIL/IAR and other software to achieve on-line debugging, downloading and programming
- (3) Flexible implementation of production of bus-line programmer

Table 52 Pin Function Configuration

11.4.2 ID code

11.4.2.1 MCU device ID code

APM32A MCU series includes a MCU ID code. It can be accessed with JTAG or SW debug interface or user code.

11.4.2.2 Boundary scan TAP

JTAG ID code

The boundary scan TAP of APM32A MCU series integrates JTAG ID code. For APM32A407xGT7 series products, its JTAG ID code is 0x06413B47

11.4.2.3 Arm® Cortex®-M4F TAP

Arm® Cortex® -M4F TAP has a JTAG ID code, which is 0x4BA00477.

11.4.2.4 Arm® Cortex® -M4F JEDEC-106 ID code

Arm® Cortex® -M4F has a JEDEC-106 ID code. It is located in 4KB ROM table in which the internal PPB bus address is 0xE0042000.

11.5 Register address mapping

31:8	Reserved		

11.6.3 Debug MCU APB1 freeze register (DBGMCU_APB1F)

This register is used to configure MCU during debugging.

Involve some APB peripherals:

- Freeze the timer counter
- Freeze I2C SMBus timeout
- Freeze supporting system window regulators and independent watchdog counters

This register is reset asynchronously by POR (instead of system reset) and can be written by the debugger through system reset.

Only support 32-bit access

Address: 0xE004 2008

Reset value: 0x0000 (unaffected by system reset)

12 General-Purpose Input/Output Pin (GPIO)

12.1 Full name and abbreviation description of terms

Table 54 Full name and abbreviation description of terms

Full name in English	English abbreviation
P-channel Metal Oxide Semiconductor	P-MOS
N-channel Metal Oxide Semiconductor	N-MOS

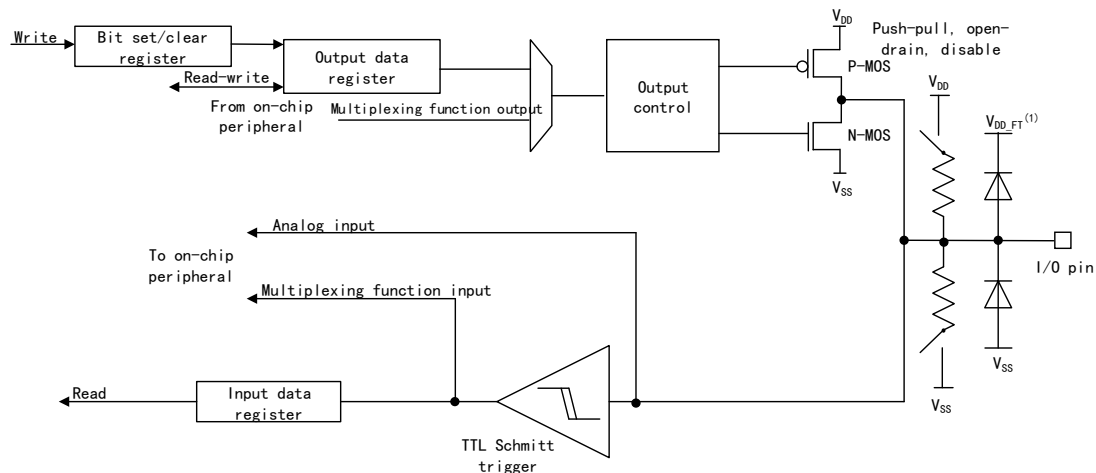

12.2 Main characteristics

GPIO port can configure the following functions through 32-bit configuration register (GPIOx_CFGLOW/GPIOx_CFGHIG) and two 32-bit data registers (GPIOx_IDATA/GPIOx_ODATA):

- (1) Input mode
 - Analog input
 - Floating input
 - Pull-up input
 - Pull-down input
- (2) Output mode
 - Push-pull output
 - Open-drain output
 - Configurable maximum output rate
- (3) Multiplexing mode
 - Push-pull multiplexing function
 - Open-drain multiplexing function
- (4) Analog function
- (5) GPIO can be used as external interrupt/wake-up line
- (6) Support locking I/O configuration function

12.3 Structure block diagram

Figure 12 5V GPIO-compatible Structure Block Diagram

(1) V_{DD_FT} is different from V_{DD} , and V_{DD_FT} is special for FT GPIO pin.

12.4 Functional description

Each pin of GPIO can be configured as pull-up, pull-down, floating and analog input, or push-pull/open-drain output input mode and multiplexing function through software. All GPIO interfaces have external interrupt capability.

12.4.1 IO status during reset and just after reset

If the multiplexing function is not enabled during and after GPIO reset, the I/O port will be configured as floating input mode, and in such case the pull-up/pull-down resistor is disabled in input mode. After reset, the JTAG pin is put in the input pull-up or pull-down mode, and the specific configuration is as follows:

- PA15: JTDI in pull-up mode
- PA14: JTCK in pull-down mode
- PA13: JTMS in pull-up mode
- PB4: JNTRST in pull-up mode
- PB3: JTDO is put in floating mode

12.4.2 Input mode

In the input mode, it can be set as pull-up, pull-down, floating and analog input.

When GPIO is configured as input mode, all GPIO pins have internal weak pull-up and weak pull-down resistors, which can be activated or disconnected.

Pull-up, pull-down, and floating modes

In (pull-up, pull-down, floating) input mode

- Schmitt trigger is opened
- Disable output buffer
- Connect weak pull-up and pull-down resistors according to different input configurations
- The input data register GPIOx_IDATA captures the data on I/O pin in each AHB1 clock cycle
- Read I/O state through the input data register GPIOx_IDATA

The initial level state of the floating input mode is uncertain and is easy to be disturbed by the outside; when connecting the equipment, it is determined by the external input level (except for the very high impedance).

The initial level state of pull-up/pull-down input mode is high level if pull-up, and low level if pull-down; when connecting the equipment, it is determined by the external input level and load impedance.

Analog input mode

In analog input mode

- Disable output buffer
- The input of Schmitt trigger is disabled, and the output value of Schmitt trigger is forced to be 0
- Weak pull-up and pull-down resistors are disabled
- The value of port input state register is 0

12.4.3 Output mode

In the output mode, it can be set as push-pull output and open-drain output.

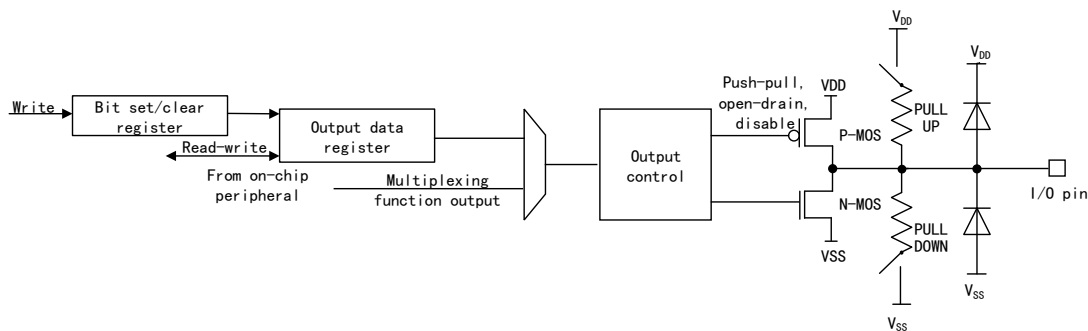

When GPIO is configured as the output pin, the output speed of the port can be configured and the output drive mode (push-pull / open-drain) can be selected.

In output mode

- Schmitt trigger is opened,
- Activate output buffer
- Weak pull-up and pull-down resistors are disabled

- Push-pull mode:
 - Double MOS transistor works by turns and the output data register can control the high and low level of I/O output
 - Read the finally written value through the output data register GPIOx_ODATA
- Open-drain mode:
 - Only N-MOS works, and the output data register can control I/O output high resistance state or low level
 - Read the actual I/O state through the input data register GPIOx_IDATA

Figure 14 I/O Structure in Output Mode

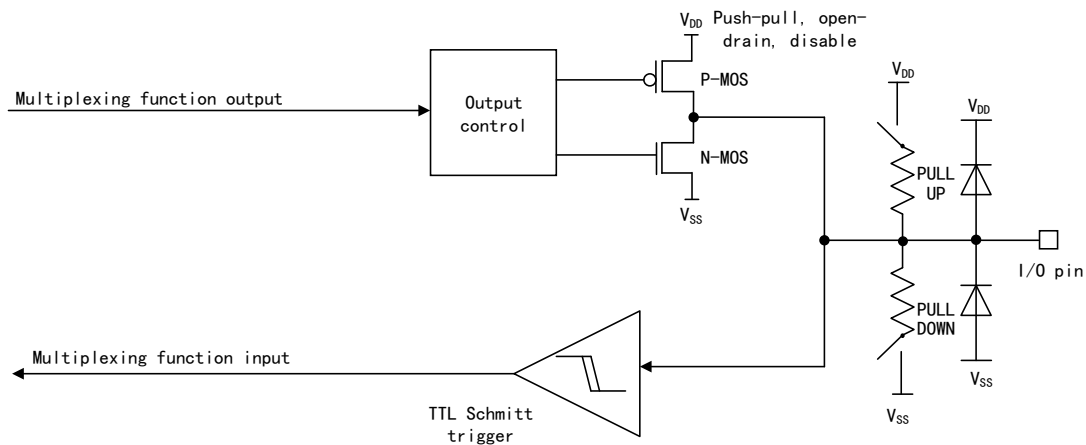

12.4.4 Multiplexing mode

In multiplexing mode, it can be set as push-pull multiplexing and open-drain multiplexing

In push-pull/open-drain multiplexed mode

- Open the output buffer
- Output buffer is driven by peripheral
- Activate schmitt trigger input
- Weak pull-up and pull-down resistors are disabled
- The data on the I/O pin is sampled in each AHB1 clock cycle and stored in the port input state register
- In open-drain mode, the actual state of I/O can be read through input data register GPIOx_IDATA
- In push-pull mode, the last written value is read through output data register GPIOx_ODATA

Figure 15 I/O Structure in Multiplexing Mode

12.4.5 External interrupt/wake-up line

All GPIO ports have external interrupt function. If you want to use external interrupt line, the port must be configured as input mode.

12.4.6 Bit set and bit clear

Software does not need to disable interrupt when programming some bits of GPIOx_IDATA. (By setting the bit to be changed in GPIOx_BSC and BSC registers to 1, the function of changing one or more bits in AHB1 write operation can be realized.

12.4.7 GPIO locking function

Locking function can be used in power driver module. The locking mechanism of GPIO can protect the configuration of I/O port. I/O configuration can be locked by configuring the lock register (GPIOx_LOCK). When a port bit executes the locking program, the configuration of port bit cannot be modified before the next reset.

12.4.8 OSC32_IN/OSC32_OUT pin

Only when LSECLK oscillator is turned off, can OSC32_IN and OSC32_OUT pins be used as general-purpose PC14 I/O and PC15 I/O. It is controlled by RCC_BDCTRL[LSEEN] bit. The priority of LSECLK is higher than GPIO function.

12.4.9 OSC_IN/OSC_OUT pin

Only when HSECLK oscillator is turned off, can OSC_IN and OSC_OUT pins be used as general-purpose PH0 I/O and PH1 I/O. It is controlled by RCC_BDCTRL[HSEEN] bit. The priority of HSECLK is higher than GPIO function.

12.5 Register address mapping

Table 55 GPIO Register Address Mapping

Register name	Description	Offset address
GPIOx_MODE	Port mode register	0x00
GPIOx_OMODE	Port output mode register	0x04

13.2 Timer category and main difference

In this series of products, there are three types of timers: advanced timer, general-purpose timer and basic timer (watchdog timer is described in other chapters).

The advanced timer includes the functions of general-purpose timer and basic timer. The advanced timer has four capture/compare channels, supports timing function, input capture and output compare function, braking and complementary output function, and is a 16-bit timer that can count up/down.

The function of general-purpose timer is simpler than that of advanced timer. The main differences are the total number of channels, the number of complementary output channel groups and the braking function.

The basic timer is a timer that can only realize timing function and has no external interface.

The main differences of timers included in the products are shown in the table below:

Table 57 Main Differences among Timers Included in the Products

UIFLG	Update interrupt flag

14 Advanced Timers (TMR1/8)

14.1 Introduction

The advanced timer takes the time base unit as the core, and has the functions of input capture, output compare and braking input, including a 16-bit automatic loading counter. Compared with other timers, the advanced timer supports complementary output, repeat count and programmable dead-time insertion function, and is more suitable for motor control.

14.2 Main characteristics

- (1) Timebase unit
 - Counter: 16-bit counter, count-up, count-down and center-aligned count
 - Prescaler: 16-bit programmable prescaler
 - Repeat counter: 16-bit repeat counter
 - Auto reloading function
- (2) Clock source selection
 - Internal clock
 - External input
 - External trigger
 - Internal trigger
- (3) Input capture function
 - Counting function
 - PWM input mode (measurement of pulse width, frequency and duty cycle)
 - Encoder interface mode
- (4) Output compare function
 - PWM output mode
 - Forced output mode
 - Single-pulse mode
 - Complementary output and dead-time insertion
- (5) Timing function
- (6) Braking function
- (7) Master/Slave mode controller of timer
 - Timers can be synchronized and cascaded
 - Support multiple slave modes and synchronization signals
- (8) Interrupt output and DMA request event
 - Update event (counter overrun/underrun, counter initialization)

- Trigger event (counter start, stop, internal/external trigger)
- Capture/Compare event
- Braking signal input event

(9) Supports incremental (quadrature) encoder and hall-sensor circuitry for positioning purposes

14.3 Structure block diagram

Figure 16 Advanced Timer Structure Block Diagram

14.4 Functional description

14.4.1 Clock source selection

The advanced timer has four clock sources.

Internal clock

It is TMRx_CLK from RCM, namely the driving clock of the timer; when the slave mode controller is disabled, the clock source CK_PSC of the prescaler is driven by the internal clock CK_INT.

External clock mode 1

The trigger signal generated from the input channel TI1/2/3/4 of the timer after polarity selection and filtering is connected to the slave mode controller to control the work of the counter. Besides, the pulse signal generated by the input of Channel 1 after double-edge detection of the rising edge and the falling edge is logically equal or the future signal is TI1F_ED signal, namely double-edge signal of TIF_ED. Specially the PWM input can only be input by TI1/2.

External clock mode 2

After polarity selection, frequency division and filtering, the signal from external trigger interface (ETR) is connected to slave mode controller through trigger input selector to control the work of counter.

Internal trigger input

The timer is set to work in slave mode, and the clock source is the output signal of other timers. At this time, the clock source has no filtering, and the synchronization or cascading between timers can be realized. The master mode timer can reset, start, stop or provide clock for the slave mode timer.

14.4.2 Timebase unit

The time base unit in the advanced timer contains four registers

- 16-bit counter register (CNT)
- 16-bit auto reload register (AUTORLD)
- 16-bit prescaler register (PSC)
- 8-bit repetition count register (REPCNT)

Repetition register is unique to advanced timer.

Counter CNT

There are three counting modes for the counter in the advanced timer

- Count-up mode
- Count-down mode
- Center-aligned mode

Count-up mode

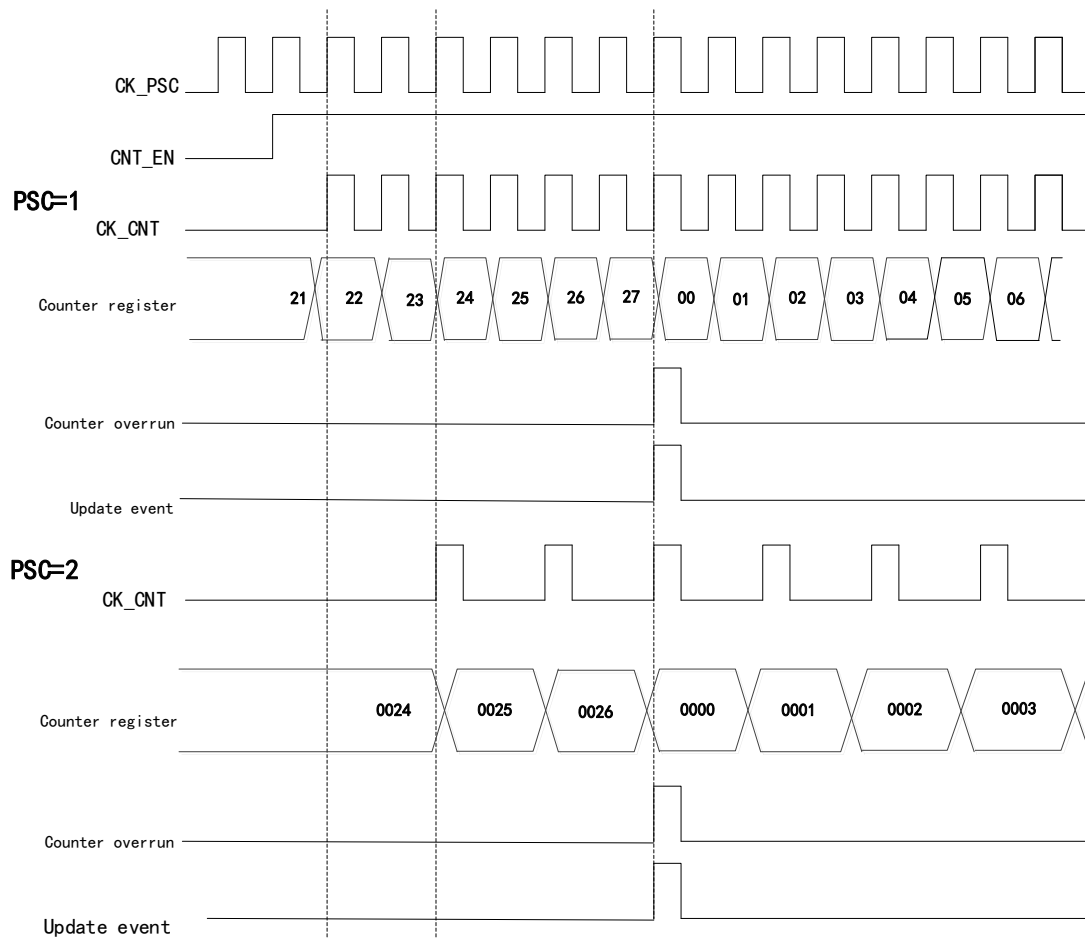

Set to the count-up mode by CNTDIR bit of configuration control register (TMRx_CTRL1).

When the counter is in count-up mode, the counter will count up from 0; every time a pulse is generated, the counter will increase by 1 and when the value of the counter (TMRx_CNT) is equal to the value of the auto reload (TMRx_AUTORLD), the counter will start to count again from 0, a count-up overrun event will be generated, and the value of the auto reload

(TMRx_AUTORLD) is written in advance. If a repeat counter is used, an update event will be generated when the number of count-up repetitions reaches the number in the repeat counter register plus one time (TMRx_REPCNT+1). Otherwise, an update event will be generated every time the counter overruns. At this time, the repeat count shadow register, the auto reload shadow register and the prescaler buffer will be updated. The update event can be disabled by UD bit of configuration control register TMRx_CTRL1.

The figure below is Timing Diagram when Division Factor is 1 or 2 in Count-up Mode

Figure 17 Timing Diagram when Division Factor is 1 or 2 in Count-up Mode

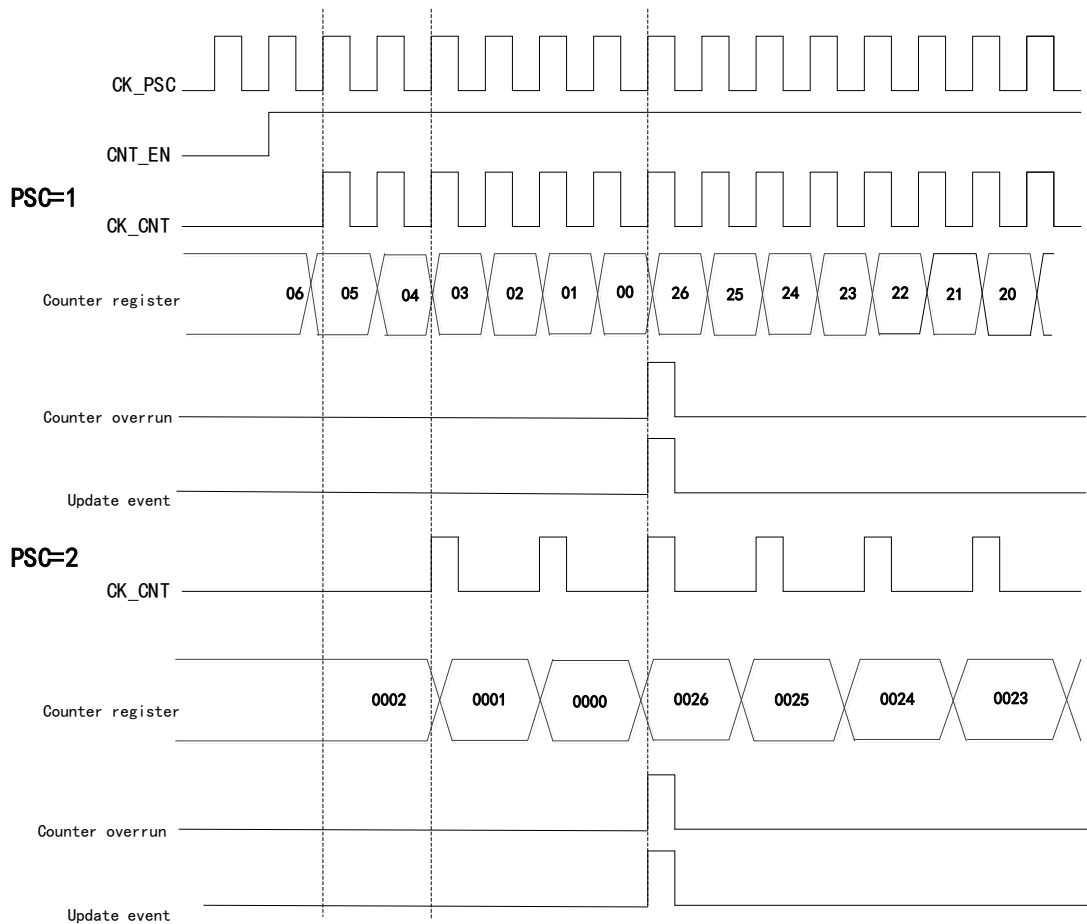

Count-down mode

Set to the count-down mode by CNTDIR bit of configuration control register (TMRx_CTRL1).

When the counter is in count-down mode, the counter will start to count down from the value of the auto reload (TMRx_AUTORLD); every time a pulse is generated, the counter will decrease by 1 and when it becomes 0, the counter will start to count again from (TMRx_AUTORLD), meanwhile, a count-down overrun event will be generated, and the value of the auto reload

(TMRx_AUTORLD) is written in advance. If a repeat counter is used, an update event will be generated when the number of count-down repetitions reaches the number in the repeat counter register plus one time (TMRx_REPCNT+1). Otherwise, an update event will be generated every time the counter underruns. At this time, the repeat count shadow register, the auto reload shadow register and the prescaler buffer will be updated. The update event can be disabled by configuring the UD bit of the TMRx_CTRL1 register.

Figure 18 Timing Diagram when Division Factor is 1 or 2 in Count-down Mode

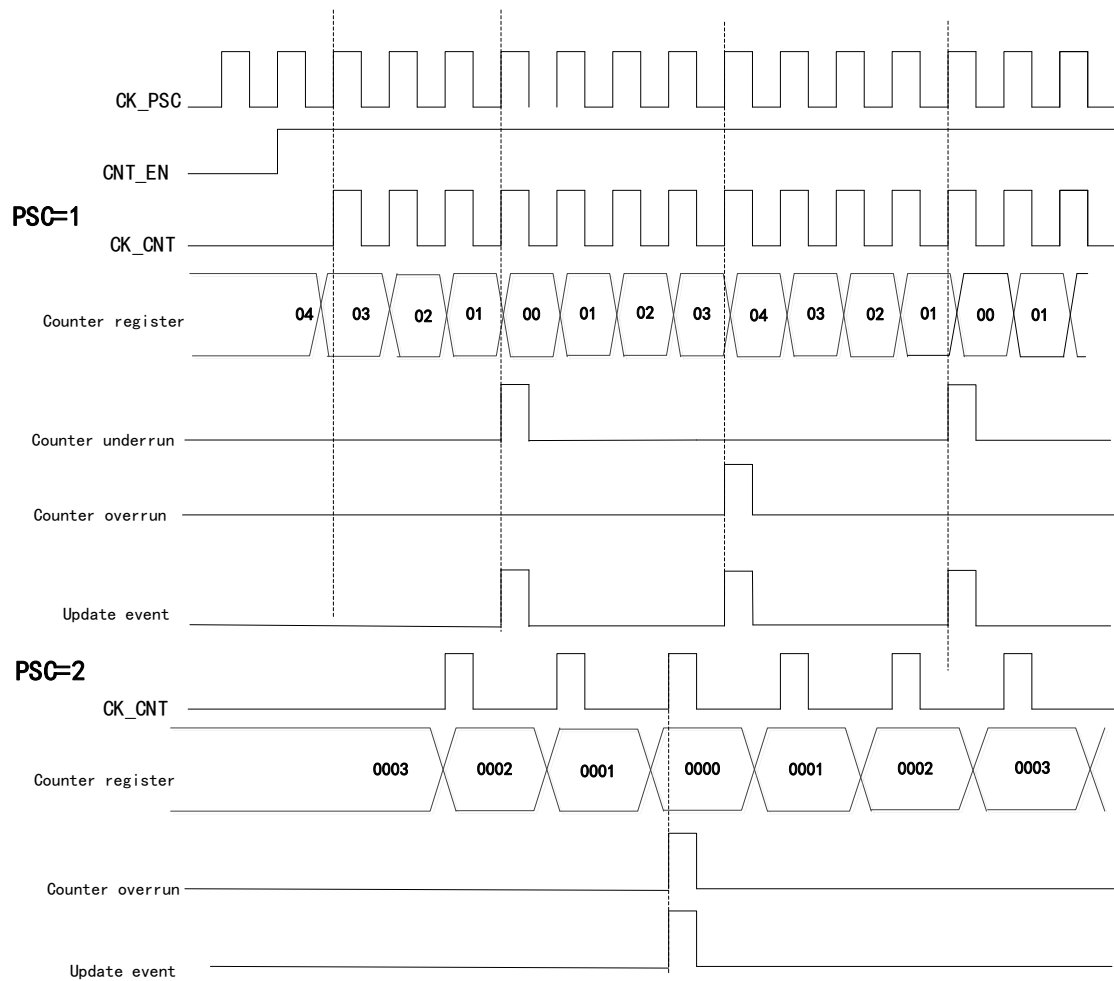

Center-aligned mode

Set to the center-aligned mode by CAMSEL bit of configuration control register (TMRx_CTRL1).

When the counter is in center-aligned mode, the counter counts up from 0 to the value of auto reload (TMRx_AUTORLD), then counts down to 0 from the value of the auto reload (TMRx_AUTORLD), which will repeat; in counting up, when the counter value is (AUTORLD-1), a counter overrun event will be generated; in counting down, when the counter value is 1, a counter underrun event will be generated.

Figure 19 Timing Diagram when Division Factor is 1 or 2 in Center-aligned Mode

Repeat counter REPCNT

There is no repeat counter REPCNT in the basic/general-purpose timer, which means that when the overrun event or underrun event occurs in the basic/general-purpose timer, an update event will be generated directly; while in the advanced timer, because of the existence of the repeat counter, when an overrun/underrun event occurs to the advanced timer, the update event will be generated only when the value of the repeat counter is 0.

For example, if the advanced timer needs to generate an update event when an overrun/underrun event occurs, the value of the repeat counter should be set to 0.

If the repeat counter function is used in the count-up mode, every time the counter counts up to AUTORLD, an overrun event will occur. At this time, the value of the repeat counter will be decreased by 1, and an update event will be generated until the value of the repeat counter is 0.

That is, when N+1 (N is the value of repeat counter) overrun/underrun events occur, an update event will be generated.

Figure 20 Timing Diagram when Setting REPCNT=2 in Count-up Mode

Prescaler PSC

The prescaler is 16 bits and programmable, and it can divide the clock frequency of the counter to any value between 1 and 65536 (controlled by TMRx_PSC register), and after frequency division, the clock will drive the counter CNT to count. The prescaler has a buffer, which can be changed during running.

14.4.3 Input capture

Input capture channel

The advanced timer has four independent capture/compare channels, each of which is surrounded by a capture/compare register.

In the input capture, the measured signal will enter from the external pin T1/2/3/4 of the timer, first pass through the edge detector and input filter, and then into the capture channel. Each capture channel has a corresponding capture register. When the capture occurs, the value of the counter CNT will be latched in the capture register CCx. Before entering the capture register, the signal will pass through the prescaler, which is used to set how many events to capture at a time.

Input capture application

Input capture is used to capture external events, and can give the time flag to indicate the occurrence time of the event and measure the pulse jump edge events (measure the frequency or pulse width), for example, if the selected edge appears on the input pin, the TMRx_CCx register will capture the current value of the counter and the CCxIFLG bit of the state register TMRx_STS will be set to 1; if CCxIEN=1, an interrupt will be generated.

In capture mode, the timing, frequency, period and duty cycle of a waveform can be measured. In the input capture mode, the edge selection is set to rising edge detection. When the rising edge appears on the capture channel, the first capture occurs, at this time, the value of the counter CNT will be latched in the capture register CCx; at the same time, it will enter the capture interrupt, a capture will be recorded in the interrupt service program and the value will be recorded. When the next rising edge is detected, the second capture occurs, the value of counter CNT will be latched in capture register CCx again, at this time, it will enter the capture interrupt again, the value of capture register will be read, and the cycle of this pulse signal will be obtained through capture.

14.4.4 Output compare

There are eight modes of output compare: freeze, channel x is valid level when matching, channel x is invalid level when matching, flip, force is invalid, force is valid, PWM mode 1 and PWM mode 2, which are configured by OCxMOD bit in TMRx_CCMx register and can control the waveform of output signal in output compare mode.

Output compare application

In the output compare mode, the position, polarity, frequency and time of the pulse generated by the timer can be controlled.

When the value of the counter is equal to that of the capture/compare register, the channel output can be set as high level, low level or flip by configuring the OCxMOD bit in TMRx_CCMx register and the CCxPOL bit in the output polarity TMRx_CCEN register.

When CCxIFLG=1 in TMRx_STS register, if CCxIEN=1 in TMRx_DIEN register, an interrupt will be generated; if CCDSEL=1 in TMRx_CTRL2 register, DMA request will be generated.

14.4.5 PWM output mode

PWM mode is an adjustable pulse signal output by the timer. The pulse width of the signal is determined by the value of the compare register CCx, and the cycle is determined by the value of the auto reload AUTORLD.

PWM output mode contains PWM mode 1 and PWM mode 2; PWM mode 1 and PWM mode 2 are divided into count-up, count-down and center alignment counting; in PWM mode 1, if the value of the counter CNT is less than the value of the compare register CCx, the output level will be valid; otherwise, it will be invalid.

Set the timing diagram in PWM mode 1 when CCx=5, AUTORLD=7

Figure 21 PWM1 Count-up Mode Timing Diagram

Figure 22 PWM1 Count-down Mode Timing Diagram

Figure 23 PWM1 Center-aligned Mode Timing Diagram

In PWM mode 2, if the value of the counter CNT is less than that of the compare register CCx, the output level will be invalid; otherwise, it will be valid.

Set the timing diagram in PWM mode 2 when CCx=5, AUTORLD=7

Figure 24 PWM2 Count-up Mode Timing Diagram

Figure 25 PWM2 Count-down Mode Timing Diagram

Figure 26 PWM2 Center-aligned Mode Timing Diagram

14.4.6 PWM input mode

PWM input mode is a particular case of input capture.

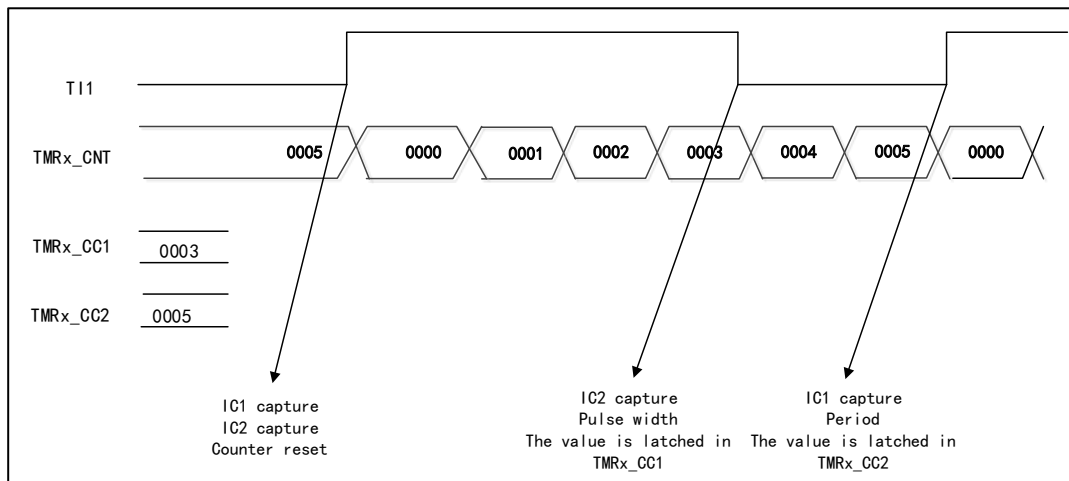

In PWM input mode, as only TI1FP1 and TI1FP2 are connected to the slave mode controller, input can be performed only through the channels TMRx_CH1 and TMRx_CH2, which need to occupy the capture registers of CH1 and CH2.

In the PWM input mode, the PWM signal enters from TMRx_CH1, and the

signal will be divided into two channels, one can measure the cycle and the other can measure the duty cycle. In the configuration, it is only required to set the polarity of one channel, and the other will be automatically configured with the opposite polarity.

In this mode, the slave mode controller should be configured as the reset mode (SMFSEL bit of TMRx_SMCTRL register)

Figure 27 PWM Input Mode Timing Diagram

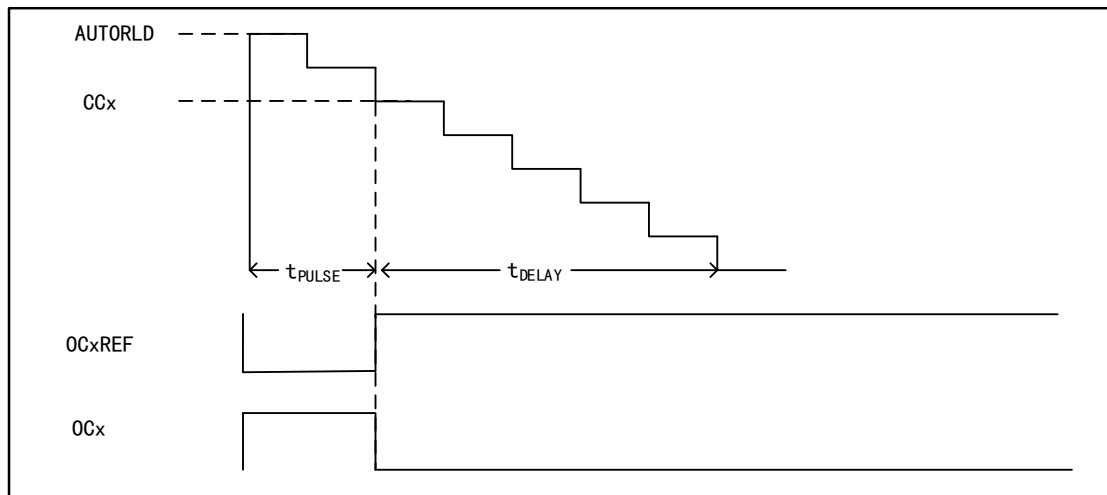

14.4.7 Single-pulse mode

The single-pulse mode is a special case of timer compare output, and is also a special case of PWM output mode.

Set SPMEN bit of TMRx_CTRL1 register, and select the single-pulse mode. After the counter is started, a certain number of pulses will be output before the update event occurs. When an update event occurs, the counter will stop counting, and the subsequent PWM waveform output will no longer be changed.

After a certain controllable delay, a pulse with controllable pulse width is generated in single-pulse mode through the program. The delay time is defined by the value of TMRx_CCx register; in the count-up mode, the delay time is CCx and the pulse width is AUTORLD-CCx; in the count-down mode, the delay time is AUTORLD-CCx and the pulse width is CCx.

Figure 28 Single-pulse Mode Timing Diagram

14.4.8 Impact of the register on output waveform

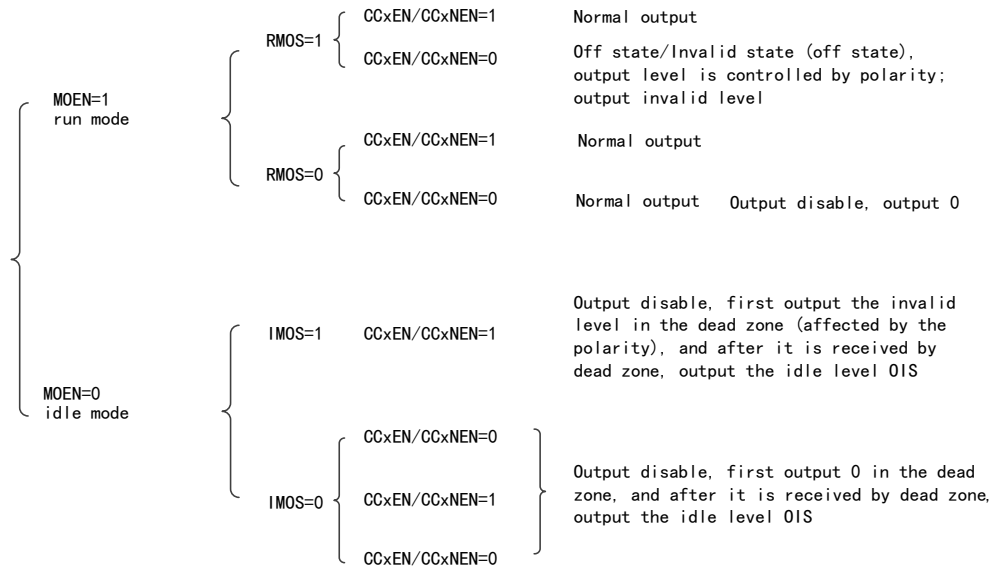

The following registers will affect the level of the timer output waveform. For details, please refer to "Register Functional Description".

- (1) CCxEN and CCxNEN bits in TMRx_CCEN register
 - CCxNEN=0 and CCxEN=0: The output is turned off (output disabled, invalid state)
 - CCxNEN=1 and CCxEN=1: The output is turned on (output enabled, normal output)
- (2) MOEN bit in TMRx_BDT register
 - MOEN=0: Idle mode
 - MOEN=1: Run mode
- (3) OCxOIS and OCxNOIS bits in TMRx_CTRL2 register
 - OCxOIS=0 and OCxNOIS=0: When idle (MOEN=0), the output level after the dead-time is 0
 - OCxOIS=1 and OCxNOIS=1: When idle (MOEN=0), the output level after the dead-time is 1
- (4) RMOS bit in TMRx_BDT register
 - Application environment of RMOS: In corresponding complementary channel and timer are in run mode (MOEN=1), the timer is not working (CCxEN=0, CCxNEN=0) or is working (CCxEN=1, CCxNEN=1)
- (5) IMOS bit in TMRx_BDT register
 - Application environment of IMOS: In corresponding complementary channel and timer are in idle mode (MOEN=0), the timer is not working (CCxEN=0, CCxNEN=0) or is working (CCxEN=1, CCxNEN=1)
- (6) CCxPOL and CCxNPOL bits of TMRx_CCEN register

- CCxPOL=0 and CCxNPOL=0: Output polarity, high level is valid
CCxPOL=1 and CCxNPOL=1: Output polarity, the low level is valid

The following figure lists the register structure relationships that affect the output waveform

Figure 29 Register Structural Relationship Affecting Output Waveform

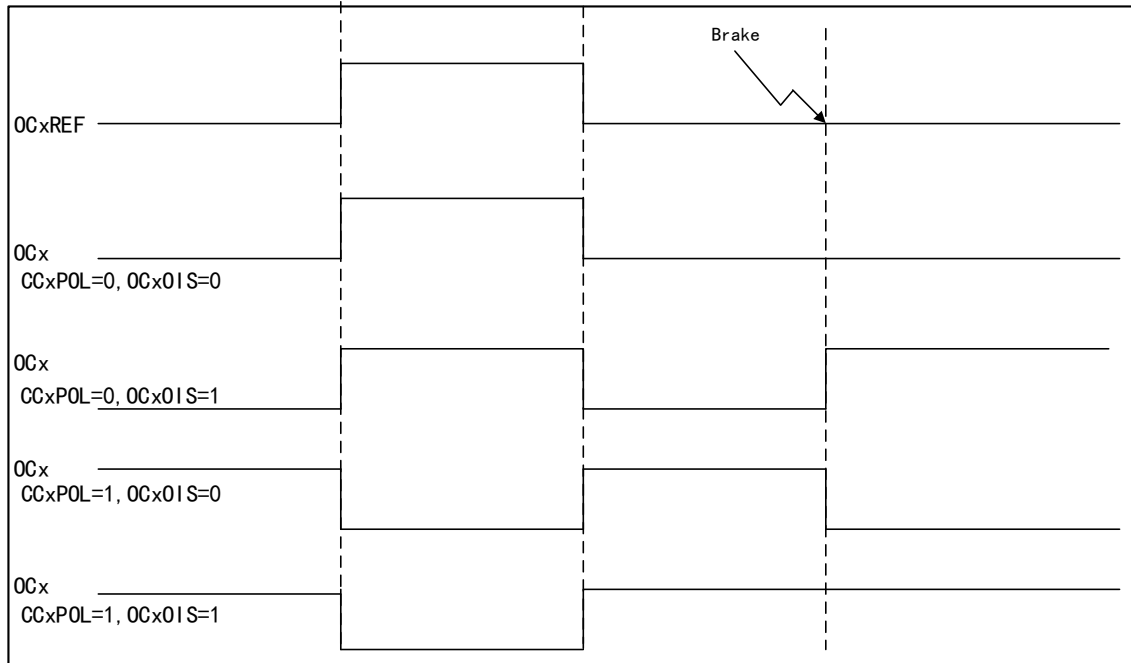

14.4.9 Braking function

The signal source of braking is clock fault event and external input interface.

Besides, the BRKEN bit in TMRx_BDT register can enable the braking function, and the BRKPOL bit can configure the polarity of braking input signal.

When a braking event occurs, the output pulse signal level can be modified according to the state of the relevant control bit.

Figure 30 Braking Event Timing Diagram

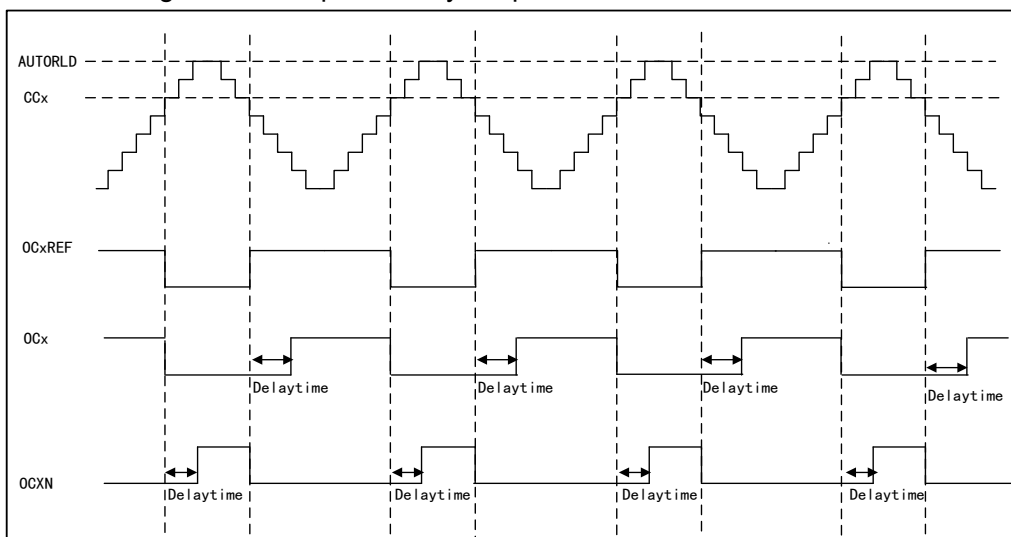

14.4.10 Complementary output and dead-time insertion

Complementary output is particular output of advanced timer, and the advanced timer has three groups of complementary output channels. The insertion dead time is used to generate complementary output signals to ensure that the two-way complementary signals of channels will not be valid at the same time. The dead time is set according to the output device connected to the timer and its characteristics

The duration of the dead-time can be controlled by configuring DTS bit of TMRx_BDT register

Figure 31 Complementary Output of Insertion with Dead-time

14.4.11 Forced output mode

In the forced output mode, the comparison result is ignored, and the corresponding level is directly output according to the configuration instruction.

- CCxSEL=00 for TMRx_CCMx register, set CCx channel as output
- OCxMOD=100/101 for TMRx_CCMx register, set to force OCxREF signal to invalid/valid state

In this mode, the corresponding interrupt and DMA request will still be generated.

14.4.12 Encoder interface mode

The encoder interface mode is equivalent to an external clock with direction selection. In the encoder interface mode, the content of the timer can always indicate the position of the encoder.

The selection method of encoder interface is as follows:

- By setting SMFSEL bit of TMRx_SMCTRL register, set the counter to count on the edge of TI1 channel /TI2 channel, or count on the edge of TI1 and TI2 at the same time.
- Select the polarity of TI1 and TI2 by setting the CC1POL and CC2POL bits of TMRx_CCEN register.
- Select to filter or not by setting the IC1F and IC2F bits of TMRx_CCM1 register.

The two input TI1 and TI2 can be used as the interface of incremental encoder. The counter is driven by the effective jump of the signals TI1FP1 and TI2FP2 after filtering and edge selection in TI1 and TI2.

The count pulse and direction signal are generated according to the input signals of TI1 and TI2

- The counter will count up/down according to the jumping sequence of the input signal.
- Set CNTDIR of control register TMRx_CTRL1 to be read-only (CNTDIR will be re-calculated due to jumping of any input end).

The change mechanism of counter count direction is shown in the figure below

Table 60 Relationship between Count Direction and Encoder

Effective edge		Count only in TI1		Count only in TI2		Count in both TI1 and TI2	
		High	Low	High	Low	High	Low
TI1FP1	Rising edge	—		Count down	Count up	Count down	Count up
	Falling edge			Count up	Count down	Count up	Count down
TI2FP2	Rising edge	Count up	Count down	—		Count up	Count down

Effective edge		Count only in T11		Count only in T12	Count in both T11 and T12	
	Falling edge	Count down	Count up		Count down	Count up

The external incremental encoder can be directly connected with MCU, not needing external interface logic, so the comparator is used to convert the differential output of the encoder to digital signal to increase the immunity from noise interference.

Among the following examples:

- IC1FP1 is mapped to T11
- IC2FP2 is mapped to T12
- Neither IC1FP1 nor IC2FP2 is reverse phase
- The input signal is valid at the rising edge and falling edge
- Enable the counter

Figure 32 Counter Operation Example in Encoder Mode

For example, when T11 is at low level, and T12 is in rising edge state, the counter will count up.

Figure 33 Example of Encoder Interface Mode of IC1FP1 Reversed Phase

For example, when T11 is at low level, and the rising edge of T12 jumps, the counter will count down.

14.4.13 Slave mode

TMRx timer can synchronize external trigger

- Reset mode
- Gated mode
- Trigger mode

SMFSEL bit in TMRx_SMCTRL register can be set to select the mode.

SMFSEL=100 set the reset mode, SMFSEL=101 set the gated mode, SMFSEL=110 set the trigger mode.

In the reset mode, when a trigger input event occurs, the counter and prescaler will be initialized, and the rising edge of the selected trigger input (TRGI) will reinitialize the counter and generate a signal to update the register.

In the gated mode, the enable of the counter depends on the high level of the selected input. When the trigger input is high, the clock of the counter will be started. Once the trigger input becomes low, the counter will stop (but not be reset). The start and stop of the counter are controlled.

In the trigger mode, the enable of the counter depends on the event on the selected input, the counter is started (but is not reset) at the rising edge of the trigger input, and only the start of the counter is controlled.

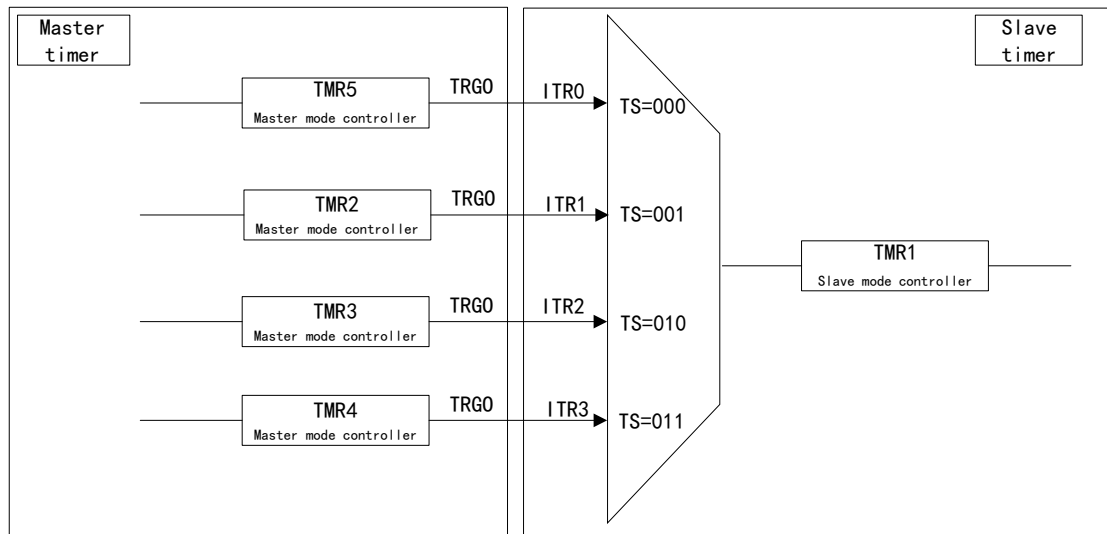

14.4.14 Timer interconnection

Each timer of TMRx can be connected with each other to realize synchronization or cascading between timers. It is required to configure one timer in master mode and the other timer in slave mode.

When the timer is in master mode, it can reset, start, stop and provide clock

source for the counter of the slave mode timer.

Figure 34 Timer 1 Master/Slave Mode Example

When the timers are interconnected:

- A timer can be used as the prescaler of other register
- Another register can be started by the enable signal of a timer
- Another register can be started by the update event of a timer
- Another register can be selected by the enable of a timer
- Two timers can be synchronized by an external trigger

14.4.15 Interrupt and DMA request

The timer can generate an interrupt when an event occurs during operation

- Update event (counter overrun/underrun, counter initialization)
- Trigger event (counter start, stop, internal/external trigger)
- Capture/Compare event
- Braking signal input event

Some internal interrupt events can generate DMA requests, and special interfaces can enable or disable DMA requests.

14.4.16 Debug mode

The TMR1/8 can be configured in debug mode and choose to stop or continue to work. It depends on the TMRx_STS bit of DBGMCU_APB2F register in DBGMCU module.

14.4.17 Clear OCxREF signal when external events occur

This function is used for output compare and PWM mode.

In one channel, the high level of ETRF input port will reduce the signal of OCxREF to low level, and the OCxCEN bit in capture/compare register TMRx_CCMx is set to 1, and OCxREF signal will remain low until the next update event.

Set TMRx to PWM mode, close the external trigger prescaler, and disable the external trigger mode 2; when ETRF input is high, set OCxCEN=0, and the output OCxREF signal is shown in the figure below.

Figure 35 OCxREF Timing Diagram

Set TMRx to PWM mode, close the external trigger prescaler, and disable the external trigger mode 2; when ETRF input is high, set OCxCEN=1, and the output OCxREF signal is shown in the figure below.

Figure 36 OCxREF Timing Diagram

14.5 Register address mapping

In the following table, all registers of the advanced timer are mapped to a 16-bit addressable (address) space.

Table 61 Advanced Timer Register Address Mapping

Register name	Description	Offset address
TMRx_CTRL1	Control register 1	0x00
TMRx_CTRL2	Control register 2	0x04
TMRx_SMCTRL	Slave mode control register	0x08
TMRx_DIEN	DMA/Interrupt enable register	0x0C
TMRx_STS	State register	0x10
TMRx_CEG	Control event generation register	0x14

Register name	Description	Offset address
TMRx_CCM1	Capture/Compare mode register 1	0x18
TMRx_CCM2	Capture/Compare mode register 2	0x1C
TMRx_CCEN	Capture/Compare enable register	0x20
TMRx_CNT	Counter register	0x24
TMRx_PSC	Prescaler register	0x28
TMRx_AUTORLD	Auto reload register	0x2C
TMRx_REPCNT	Repeat count register	0x30
TMRx_CC1	Channel 1 capture/compare register	0x34
TMRx_CC2	Channel 2 capture/compare register	0x38
TMRx_CC3	Channel 3 capture/compare register	0x3C
TMRx_CC4	Channel 4 capture/compare register	0x40
TMRx_BDT	Braking and dead-time register	0x44
TMRx_DCTRL	DMA control register	0x48
TMRx_DMADDR	DMA address register of continuous mode	0x4C

14.6 Register functional description

14.6.1 Control register 1 (TMRx_CTRL1)

Offset address: 0x00

Reset value: 0x0000

Field	Name	R/W	Description
0	CNTEN	R/W	Counter Enable 0: Disable 1: Enable When the timer is configured as external clock, gated mode and encoder mode, it is required to write 1 to the bit by software to start regular work; when it is configured as the trigger mode, it can be written to 1 by hardware.
1	UD	R/W	Update Disable Update event can cause AUTORLD, PSC and CCx to generate the value of update setting. 0: Update event is allowed (UEV) An update event can occur in any of the following situations: The counter overruns/underruns; Set UEG bit; Update generated by slave mode controller. 1: Update event is disabled
2	URSSEL	R/W	Update Request Source Select If interrupt or DMA is enabled, the update event can generate update interrupt or DMA request. Different update request sources can be selected through this bit.

Field	Name	R/W	Description
			0: The counter overruns or underruns Set UEG bit; Update generated by slave mode controller. 1: The counter overruns or underruns
3	SPMEN	R/W	Single Pulse Mode Enable When an update event is generated, the output level of the channel can be changed; in this mode, the CNTEN bit will be cleared, the counter will be stopped, and the output level of the channel will not be changed. 0: Disable 1: Enable
4	CNTDIR	R/W	Counter Direction This bit is read-only when the counter is configured as center-aligned mode or encoder mode. 0: Count up 1: Count down
6:5	CAMSEL	R/W	Center Aligned Mode Select In the center-aligned mode, the counter counts up and down alternately; otherwise, it will only count up or down. Different center-aligned modes affect the timing of setting the output compare interrupt flag bit of the output channel to 1; when the counter is disabled (CNTEN=0), select the center-aligned mode. 00: Edge alignment mode 01: Center-aligned mode 1 (the output compare interrupt flag bit of output channel is set to 1 when counting down) 10: Center-aligned mode 2 (the output compare interrupt flag bit of output channel is set to 1 when counting up) 11: Center-aligned mode 3 (the output compare interrupt flag bit of output channel is set to 1 when counting up/down)
7	ARPEN	R/W	Auto-reload Preload Enable When the buffer is disabled, the program modification TMRx_AUTORLD will immediately modify the values loaded to the counter; when the buffer is enabled, the program modification TMRx_AUTORLD will modify the values loaded to the counter in the next update event. 0: Disable 1: Enable
9:8	CLKDIV	R/W	Clock Divide Factor For the configuration of dead time and digital filter, CK_INT provides the clock, and the dead time and the clock of the digital filter can be adjusted by setting this bit. 00: $t_{DTS}=t_{CK_INT}$ 01: $t_{DTS}=2 \times t_{CK_INT}$ 10: $t_{DTS}=4 \times t_{CK_INT}$ 11: Reserved
15:10	Reserved		

14.6.2 Control register 2 (TMRx_CTRL2)

Offset address: 0x04

Reset value: 0x0000

Field	Name	R/W	Description
0	CCPEN	R/W	<p>Capture/Compare Preloaded Enable</p> <p>This bit affects the change of CCxEN, CCxNEN and OCxMOD values. When preloading is disabled, the program modification will immediately affect the timer setting; When preloading is enabled, it is only updated after COMG is set, so as to affect the setting of timer; this bit only works on channels with complementary output.</p> <p>0: Disable 1: Enable</p>
1	Reserved		
2	CCUSEL	R/W	<p>Capture/compare Control Update Select</p> <p>Only when the capture/compare preload is enabled (CCPEN=1), it works only for complementary output channel.</p> <p>0: It can only be updated by setting COMG bit 1: It can be updated by setting COMG bit or rising edge on TRGI</p>
3	CCDSEL	R/W	<p>Capture/compare DMA Select</p> <p>0: Transmit DMA request of CCx when CCx event occurs 1: Transmit DMA request of CCx when an update event occurs</p>
6:4	MMSEL	R/W	<p>Master Mode Signal Select</p> <p>The signals of timers working in master mode can be used for TRGO, which affects the work of timers in slave mode and cascaded with master timer, and specifically affects the configuration of timers in slave mode.</p> <p>000: Reset; the reset signal of master mode timer is used for TRGO 001: Enable; the counter enable signal of master mode timer is used for TRGO 010: Update; the update event of master mode timer is used for TRGO 011: Compare pulses; when the master mode timer captures/compares successfully (CCxIFLG=1), a pulse signal is output for TRGO 100: Compare mode 1; OC1REF is used to trigger TRGO 101: Compare mode 2; OC2REF is used to trigger TRGO 110: Compare mode 3; OC3REF is used to trigger TRGO 111: Compare mode 4; OC4REF is used to trigger TRGO</p>
7	TI1SEL	R/W	<p>Timer Input 1 Selection</p> <p>0: TMRx_CH1 pin is connected to TI1 input 1: TMRx_CH1, TMRx_CH2 and TMRx_CH3 pins are connected to TI1 input after exclusive</p>
8	OC1OIS	R/W	<p>OC1 Output Idle State Configure</p> <p>Only the level state after the dead time of OC1 is affected when MOEN=0 and OC1N is realized.</p> <p>0: OC1=0 1: OC1=1</p> <p>Note: When LOCKCFG bit in TMRx_BDT register is at the Level 1, 2 or 3, this bit cannot be modified.</p>
9	OC1NOIS	R/W	<p>OC1N Output Idle State Configure</p> <p>Only the level state after the dead time of OC1 is affected when MOEN=0 and OC1N is realized.</p> <p>0: OC1N=0 1: OC1N=1</p>

Field	Name	R/W	Description
			Note: When PLOCKCFG bit in TMRx_BDT register is at the Level 1, 2 or 3, this bit cannot be modified.
10	OC2OIS	R/W	Configure OC2 output idle state. Refer to OC1OIS bit
11	OC2NOIS	R/W	Configure OC2N output idle state. Refer to OC1NOIS bit
12	OC3OIS	R/W	Configure OC3 output idle state. Refer to OC1OIS bit
13	OC3NOIS	R/W	Configure OC3N output idle state. Refer to OC1NOIS bit
14	OC4OIS	R/W	Configure OC4 output idle state. Refer to OC1OIS bit
15	Reserved		

14.6.3 Slave mode control register (TMRx_SMCTRL)

Offset address: 0x08

Reset value: 0x0000

Field	Name	R/W	Description
2:0	SMFSEL	R/W	<p>Slave Mode Function Select</p> <p>000: Disable the slave mode, the timer can be used as master mode timer to affect the work of slave mode timer; if CTRL1_CNTEN=1, the prescaler is directly driven by the internal clock.</p> <p>001: Encoder mode 1; according to the level of TI1FP1, the counter counts at the edge of TI2FP2.</p> <p>010: Encoder mode 2; according to the level of TI2FP2, the counter counts at the edge of TI1FP1.</p> <p>011: Encoder mode 3; according to the input level of another signal, the counter counts at the edge of TI1FP1 and TI2FP2.</p> <p>100: Reset mode; the slave mode timer resets the counter after receiving the rising edge signal of TRGI and generates the signal to update the register.</p> <p>101: Gated mode; the slave mode timer starts the counter to work after receiving the TRGI high level signal; it stops the counter when receiving TRGI low level; when receiving TRGI high level signal again, the timer will continue to work; the counter is not reset during the whole period.</p> <p>110: Trigger mode, the slave mode timer starts the counter to work after receiving the rising edge signal of TRGI.</p> <p>111: External clock mode 1; select the rising edge signal of TRGI as the clock source to drive the counter to work.</p>
3	Reserved		

Field	Name	R/W	Description

14.6.6 Control event generation register (TMRx_CEG)

Offset address: 0x14

Reset value: 0x0000

Field	Name	R/W	Description
0	UEG	W	Update Event Generate 0: Invalid 1: Initialize the counter and generate the update event This bit is set to 1 by software, and cleared by hardware. Note: When an update event is generated, the counter of the prescaler will be cleared, but the prescaler factor remains unchanged. In the count-down mode, the counter reads the value of TMRx_AUTORLD; in center-aligned mode or count-up mode, the counter will be cleared to 0.
1	CC1EG	W	Capture/Compare Channel1 Event Generation 0: Invalid 1: Capture/Compare event is generated This bit is set to 1 by software and cleared automatically by hardware. If Channel 1 is in output mode: When CC1IFLG=1, if CC1IEN and CC1DEN bits are set, the corresponding interrupt and DMA request will be generated. If Channel 1 is in input mode: The value of the capture counter is stored in TMRx_CC1 register; configure CC1IFLG=1, and if CC1IEN and CC1DEN bits are also set, the corresponding interrupt and DMA request will be generated; at this time, if CC1IFLG=1, it is required to configure CC1RCFLG=1.
2	CC2EG	W	Capture/Compare Channel2 Event Generation Refer to CC1EG description
3	CC3EG	W	Capture/Compare Channel3 Event Generation Refer to CC1EG description
4	CC4EG	W	Capture/Compare Channel4 Event Generation Refer to CC1EG description

Field	Name	R/W	Description
5	COMG	W	Capture/Compare Control Update Event Generate 0: Invalid 1: Capture/Compare update event is generated This bit is set to 1 by software and cleared automatically by hardware. Note: COMG bit is valid only in complementary output channel.
6	TEG	W	Trigger Event Generate 0: Invalid 1: Trigger event is generated This bit is set to 1 by software and cleared automatically by hardware.
7	BEG	W	Brake Event Generate 0: Invalid 1: Brake event is generated This bit is set to 1 by software and cleared automatically by hardware.
15:8	Reserved		

14.6.7 Capture/Compare mode register 1 (TMRx_CCM1)

Offset address: 0x18

Reset value: 0x0000

The timer can be configured as input (capture mode) or output (compare mode) by CCxSEL bit. The functions of other bits of the register are different in input and output modes, and the functions of the same bit are different in output mode and input mode. The OCX in the register describes the function of the channel in the output mode, and the ICx in the register describes the function of the channel in the input mode.

Output compare mode:

Field	Name	R/W	Description
1:0	CC1SEL	R/W	Capture/Compare Channel 1 Selection This bit defines the input/output direction and the selected input pin. 00: CC1 channel is output 01: CC1 channel is input, and IC1 is mapped on TI1 10: CC1 channel is input, and IC1 is mapped on TI2 11: CC1 channel is input, and IC1 is mapped on TRC, and only works in internal trigger input Note: This bit can be written only when the channel is closed (TMRx_CCEN register CC1EN=0).
2	OC1FEN	R/W	Output Compare Channel1 Fast Enable 0: Disable 1: Enable This bit is used to improve the response of the capture/compare output to the trigger input event.

Field	Name	R/W	Description
3	OC1PEN	R/W	<p>Output Compare Channel1 Preload Enable</p> <p>0: Preloading function is disabled; write the value of TMRx_CC1 register through the program and it will work immediately.</p> <p>1: Preloading function is enabled; write the value of TMRx_CC1 register through the program and it will work after an update event is generated.</p> <p>Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. When the preload register is uncertain, PWM mode can be used only in single pulse mode (SPMEN=1); otherwise, the following output compare result is uncertain.</p>
6:4	OC1MOD	R/W	<p>Output Compare Channel1 Mode Configure</p> <p>000: Freeze The output compare has no effect on OC1REF</p> <p>001: The output value is high when matching. When the value of counter CNT matches the value CCx of capture compare register, OC1REF will be forced to be at high level</p> <p>010: The output value is low when matching. When the value of the counter matches the value of the capture compare register, OC1REF will be forced to be at low level</p> <p>011: Output flaps when matching. When the value of the counter matches the value of the capture compare register, flap the level of OC1REF</p> <p>100: The output is forced to be low Force OC1REF to be at low level</p> <p>101: The output is forced to be high. Force OC1REF to be at high level</p> <p>110: PWM mode 1 (set to high when the counter value < output compare value; otherwise, set to low)</p> <p>111: PWM mode 2 (set to high when the counter value > output compare value; otherwise, set to low)</p> <p>Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. In PWM modes 1 and 2, the OC1REF level changes when the comparison result changes or when the output compare mode changes from freeze mode to PWM mode.</p>
7	OC1CEN	R/W	<p>Output Compare Channel1 Clear Enable</p> <p>0: OC1REF is unaffected by ETRF input.</p> <p>1: When high level of ETRF input is detected, OC1REF=0</p>

15:13	Reserved		

14.6.20 DMA address register of continuous mode (TMRx_DMADDR)

Offset address: 0x4C

Reset value: 0x0000

Field	Name	R/W	Description
15:0	DMADDR	R/W	<p>DMA Register for Burst Transfer</p> <p>Read or write operation access of TMRx_DMADDR register may lead to access operation of the register in the following address: TMRx_CTRL1 address + (DBADDR+DMA index) ×4</p> <p>Wherein: "TMRx_CTRL1 address" is the address of control register 1 (TMRx_CTRL1); "DBADDR" is the base address defined in TMRx_DCTRL register; "DMA index" is the offset automatically controlled by DMA, and it depends on DBLEN defined in TMRx_DCTRL register.</p>

15 General-purpose timer (TMR2/3/4/5)

15.1 Introduction

The general-purpose timer takes the time base unit as the core, and has the functions of input capture and output compare, and can be used to measure the pulse width, frequency and duty cycle, and generate the output waveform. It includes a 16-bit or 32-bit auto reload counter (realize count-up, count-down and center-aligned count).

The timer and timer are independent of each other, and they can achieve synchronization and cascading.

15.2 Main characteristics

- (1) Timebase unit
 - Counter: 16-bit or 32-bit counter, count-up, count-down and center alignment count.
 - Prescaler: 16-bit programmable prescaler
 - Auto reloading function
- (2) Clock source selection
 - Internal clock
 - External input
 - External trigger
 - Internal trigger
- (3) Input capture function
 - Counting function
 - PWM input
 - Encoder interface mode
- (4) Output compare function
 - PWM output mode
 - Forced output mode
 - Single-pulse mode
- (5) Master/Slave mode controller of timer
 - Timers can be synchronized and cascaded
 - Support multiple slave modes and synchronization signals
- (6) Interrupt and DMA request event
 - Update event (counter overrun/underrun, counter initialization)
 - Trigger event (counter start, stop, internal/external trigger)
 - Input capture
 - Output compare

- (7) Supports incremental (quadrature) encoder and hall-sensor circuitry for positioning purposes

15.3 Structure block diagram

Figure 37 General-purpose Timer Structure Block Diagram

15.4 Functional description

15.4.1 Clock source selection

The general-purpose timer has four clock sources.

Internal clock

It is TMRx_CLK from RCM, namely the driving clock of the timer; when the slave mode controller is disabled, the clock source CK_PSC of the prescaler is driven by the internal clock CK_INT.

External clock mode 1

The trigger signal generated from the input channel TI1/2/3/4 of the timer after polarity selection and filtering is connected to the slave mode controller to control the work of the counter. Besides, the pulse signal generated by the input of Channel 1 after double-edge detection of the rising edge and the falling edge

is logically equal or the future signal is TI1F_ED signal, namely double-edge signal of TIF_ED. Specially the PWM input can only be input by TI1/2.

External clock mode 2

After polarity selection, frequency division and filtering, the signal from external trigger interface (ETR) is connected to slave mode controller through trigger input selector to control the work of counter.

Internal trigger input

The timer is set to work in slave mode, and the clock source is the output signal of other timers. At this time, the clock source has no filtering, and the synchronization or cascading between timers can be realized. The master mode timer can reset, start, stop or provide clock for the slave mode timer.

15.4.2 Timebase unit

The time base unit in the general-purpose timer contains three registers

- 16-bit counter register (CNT)
- 16-bit auto reload register (AUTORLD)
- 16-bit prescaler register (PSC)

Counter CNT

There are three counting modes for the counter in the general-purpose timer

- Count-up mode
- Count-down mode
- Center-aligned mode

Count-up mode

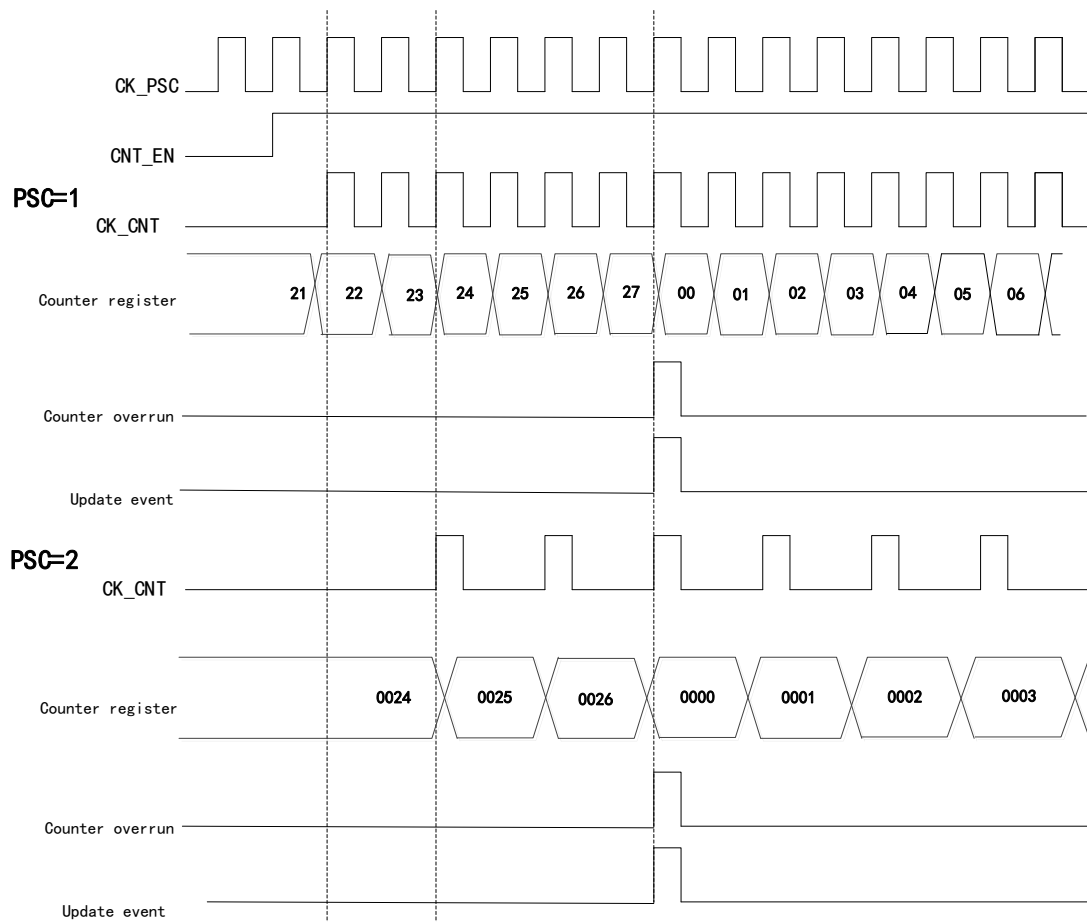

Set to the count-up mode by CNTDIR bit of configuration control register (TMRx_CTRL1).

When the counter is in count-up mode, the counter will count up from 0; every time a pulse is generated, the counter will increase by 1 and when the value of the counter (TMRx_CNT) is equal to the value of the auto reload (TMRx_AUTORLD), the counter will start to count again from 0, a count-up overrun event will be generated, and the value of the auto reload (TMRx_AUTORLD) is written in advance.

When the counter overruns, an update event will be generated. At this time, the auto reload shadow register and the prescaler buffer will be updated. The update event can be disabled by UD bit of configuration control register TMRx_CTRL1.

The figure below is Timing Diagram when Division Factor is 1 or 2 in Count-up Mode

Figure 38 Timing Diagram when Division Factor is 1 or 2 in Count-up Mode

Count-down mode

Set to the count-down mode by CNTDIR bit of configuration control register (TMRx_CTRL1).

When the counter is in count-down mode, the counter will start to count down from the value of the auto reload (TMRx_AUTORLD); every time a pulse is generated, the counter will decrease by 1 and when it becomes 0, the counter will start to count again from (TMRx_AUTORLD), meanwhile, a count-down overrun event will be generated, and the value of the auto reload (TMRx_AUTORLD) is written in advance.

When the counter overruns, an update event will be generated. At this time, the auto reload shadow register and the prescaler buffer will be updated. The update event can be disabled by configuring the UD bit of the TMRx_CTRL1 register.

Figure 39 Timing Diagram when Division Factor is 1 or 2 in Count-down Mode

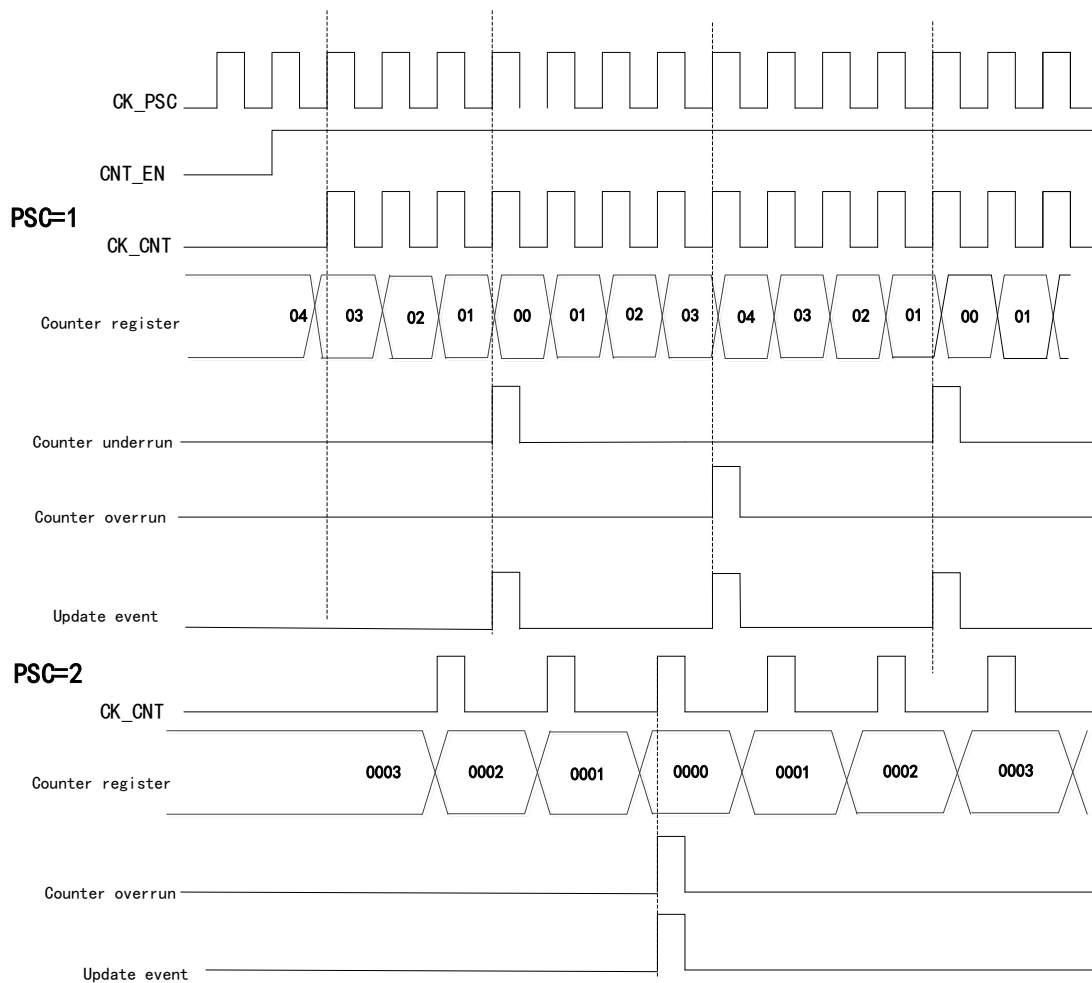

Center-aligned mode

Set to the center-aligned mode by CNTDIR bit of configuration control register (TMRx_CTRL1).

When the counter is in center-aligned mode, the counter counts up from 0 to the value of auto reload (TMRx_AUTORLD), then counts down to 0 from the value of the auto reload (TMRx_AUTORLD), which will repeat; in counting up, when the counter value is (AUTORLD-1), a counter overrun event will be generated; in counting down, when the counter value is 1, a counter underrun event will be generated.

Figure 40 Timing Diagram when Division Factor is 1 or 2 in Center-aligned Mode

Prescaler PSC

The prescaler is 16 bits and programmable, and it can divide the clock frequency of the counter to any value between 1 and 65536 (controlled by TMRx_PSC register), and after frequency division, the clock will drive the counter CNT to count. The prescaler has a buffer, which can be changed during running.

15.4.3 Input capture

Input capture channel

The general-purpose timer has four independent capture/compare channels, each of which is surrounded by a capture/compare register.

In the input capture, the measured signal will enter from the external pin T1/2/3/4 of the timer, first pass through the edge detector and input filter, and then into the capture channel. Each capture channel has a corresponding capture register. When the capture occurs, the value of the counter CNT will be latched in the capture register CCx. Before entering the capture register, the

signal will pass through the prescaler, which is used to set how many events to capture at a time.

Input capture application

Input capture is used to capture external events, and can give the time flag to indicate the occurrence time of the event and measure the pulse jump edge events (measure the frequency or pulse width), for example, if the selected edge appears on the input pin, the TMRx_CCx register will capture the current value of the counter and the CCxIFLG bit of the state register TMRx_STS will be set to 1; if CCxIEN=1, an interrupt will be generated.

In capture mode, the timing, frequency, period and duty cycle of a waveform can be measured. In the input capture mode, the edge selection is set to rising edge detection. When the rising edge appears on the capture channel, the first capture occurs, at this time, the value of the counter CNT will be latched in the capture register CCx; at the same time, it will enter the capture interrupt, a capture will be recorded in the interrupt service program and the value will be recorded. When the next rising edge is detected, the second capture occurs, the value of counter CNT will be latched in capture register CCx again, at this time, it will enter the capture interrupt again, the value of capture register will be read, and the cycle of this pulse signal will be obtained through capture.

15.4.4 Output compare

There are eight modes of output compare: freeze, channel x is valid level when matching, channel x is invalid level when matching, flip, force is invalid, force is valid, PWM mode 1 and PWM mode 2, which are configured by OCxMOD bit in TMRx_CCMx register and can control the waveform of output signal in output compare mode.

Output compare application

In the output compare mode, the position, polarity, frequency and time of the pulse generated by the timer can be controlled.

When the value of the counter is equal to that of the capture/compare register, the channel output can be set as high level, low level or flip by configuring the OCxMOD bit in TMRx_CCMx register and the CCxPOL bit in the output polarity TMRx_CCEN register.

When CCxIFLG=1 in TMRx_STS register, if CCxIEN=1 in TMRx_DIEN register, an interrupt will be generated; if CCDSEL=1 in TMRx_CTRL2 register, DMA request will be generated.

15.4.5 PWM output mode

PWM mode is an adjustable pulse signal output by the timer. The pulse width of the signal is determined by the value of the compare register CCx, and the cycle

is determined by the value of the auto reload AUTORLD.

PWM output mode contains PWM mode 1 and PWM mode 2; PWM mode 1 and PWM mode 2 are divided into count-up, count-down and center alignment counting; in PWM mode 1, if the value of the counter CNT is less than the value of the compare register CCx, the output level will be valid; otherwise, it will be invalid.

Set the timing diagram in PWM mode 1 when CCx=5, AUTORLD=7:

Figure 41 PWM1 Count-up Mode Timing Diagram

Figure 42 PWM1 Count-down Mode Timing Diagram

Figure 43 PWM1 Center-aligned Mode Timing Diagram

In PWM mode 2, if the value of the counter CNT is less than that of the compare register CCx, the output level will be invalid; otherwise, it will be valid.

Set the timing diagram in PWM mode 2 when CCx=5, AUTORLD=7

Figure 44 PWM2 Count-up Mode Timing Diagram

Figure 45 PWM2 Count-down Mode Timing Diagram

Figure 46 PWM2 Center-aligned Mode Timing Diagram

15.4.6 PWM input mode

PWM input mode is a particular case of input capture.

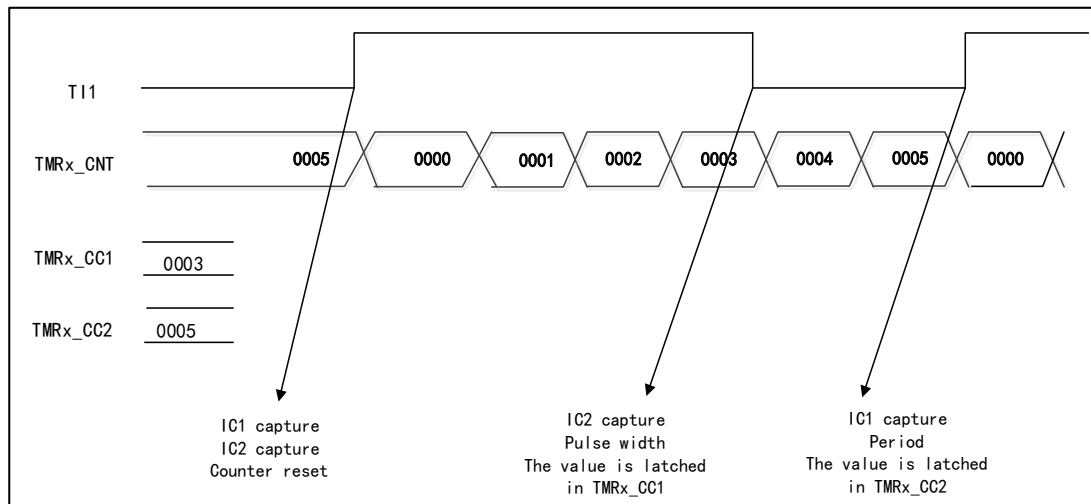

In PWM input mode, as only TI1FP1 and TI1FP2 are connected to the slave

mode controller, input can be performed only through the channels TMRx_CH1 and TMRx_CH2, which need to occupy the capture registers of CH1 and CH2.

In PWM input mode, the PWM signal enters from TMRx_CH1, and the signal will be divided into two channels, one can measure the period, and the other can measure the duty cycle. In the configuration, it is only required to set the polarity of one channel, and the other will be automatically configured with the opposite polarity.

In this mode, the slave mode controller should be configured as the reset mode (SMFSEL bit of TMRx_SMCTRL register)

Figure 47 PWM Input Mode Timing Diagram

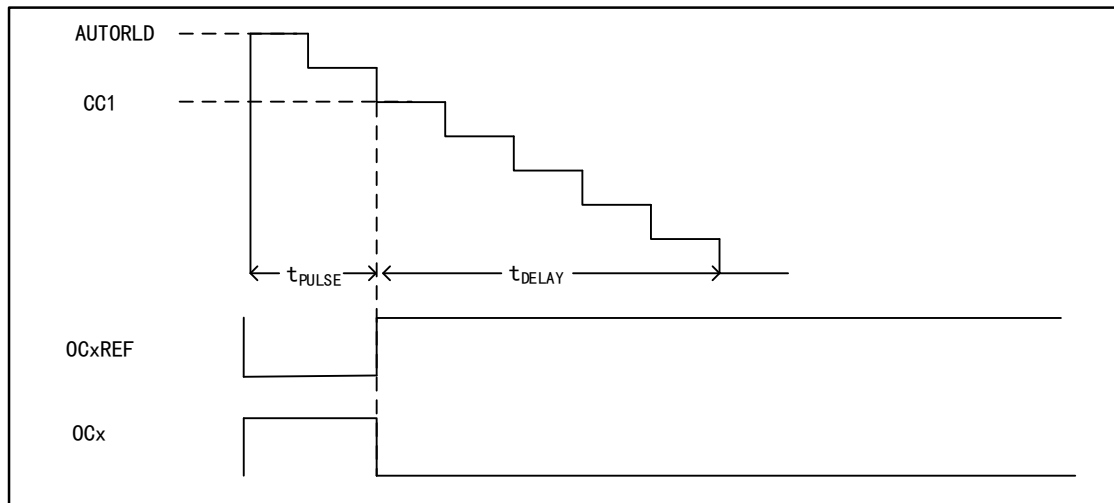

15.4.7 Single-pulse mode

The single-pulse mode is a special case of timer compare output, and is also a special case of PWM output mode.

Set SP MEN bit of TMRx_CTRL1 register, and select the single-pulse mode. After the counter is started, a certain number of pulses will be output before the update event occurs. When an update event occurs, the counter will stop counting, and the subsequent PWM waveform output will no longer be changed.

After a certain controllable delay, a pulse with controllable pulse width is generated in single-pulse mode through the program. The delay time is defined by the value of TMRx_CCx register; in the count-up mode, the delay time is CCx and the pulse width is AUTORLD-CCx; in the count-down mode, the delay time is AUTORLD-CCx and the pulse width is CCx.

Figure 48 Timing Diagram in Single-pulse Mode

15.4.8 Forced output mode

In the forced output mode, the comparison result is ignored, and the corresponding level is directly output according to the configuration instruction.

- CCxSEL=00 for TMRx_CCMx register, set CCx channel as output
- OCxMOD=100/101 for TMRx_CCMx register, set to force OCxREF signal to invalid/valid state

In this mode, the corresponding interrupt and DMA request will still be generated.

15.4.9 Encoder interface mode

The encoder interface mode is equivalent to an external clock with direction selection. In the encoder interface mode, the content of the timer can always indicate the position of the encoder.

The selection method of encoder interface is as follows:

- By setting SMFSEL bit of TMRx_SMCTRL register, set the counter to count on the edge of TI1 channel /TI2 channel, or count on the edge of TI1 and TI2 at the same time.
- Select the polarity of TI1 and TI2 by setting the CC1POL and CC2POL bits of TMRx_CCEN register.
- Select to filter or not by setting the IC1F and IC2F bits of TMRx_CCM1 register.

The two input TI1 and TI2 can be used as the interface of incremental encoder. The counter is driven by the effective jump of the signals TI1FP1 and TI2FP2 after filtering and edge selection in TI1 and TI2.

The count pulse and direction signal are generated according to the input signals of TI1 and TI2

- The counter will count up/down according to the jumping sequence of the input signal

- Set CNTDIR of control register TMRx_CTRL1 to be read-only (CNTDIR will be re-calculated due to jumping of any input end)

The change mechanism of counter count direction is shown in the figure below:

Table 63 Relationship between Count Direction and Encoder

Effective edge		Count only in TI1		Count only in TI2		Count in both TI1 and TI2	
Level of relative signal		High	Low	High	Low	High	Low
TI1FP1	Rising edge	—		Count down	Count up	Count down	Count up
	Falling edge			Count up	Count down	Count up	Count down
TI2FP2	Rising edge	Count up	Count down	—		Count up	Count down
	Falling edge	Count down	Count up			Count down	Count up

The external incremental encoder can be directly connected with MCU, not needing external interface logic, so the comparator is used to convert the differential output of the encoder to digital signal to increase the immunity from noise interference.

Among the following examples:

- IC1FP1 is mapped to TI1
- IC2FP2 is mapped to TI2
- Neither IC1FP1 nor IC2FP2 is reverse phase
- The input signal is valid at the rising edge and falling edge
- Enable the counter

Figure 49 Counter Operation Example in Encoder Mode

For example, when T11 is at low level, and T12 is in rising edge state, the counter will count up.

Figure 50 Example of Encoder Interface Mode of IC1FP1 Reversed Phase

For example, when T11 is at low level, and the rising edge of T12 jumps, the counter will count down.

15.4.10 Slave mode

TMRx timer can synchronize external trigger

- Reset mode
- Gated mode
- Trigger mode

SMFSEL bit in TMRx_SMCTRL register can be set to select the mode

SMFSEL=100 set the reset mode, SMFSEL=101 set the gated mode, SMFSEL=110 set the trigger mode.

In the reset mode, when a trigger input event occurs, the counter and prescaler will be initialized, and the rising edge of the selected trigger input (TRGI) will reinitialize the counter and generate a signal to update the register.

In the gated mode, the enable of the counter depends on the high level of the selected input. When the trigger input is high, the clock of the counter will be started. Once the trigger input becomes low, the counter will stop (but not be reset). The start and stop of the counter are controlled.

In the trigger mode, the enable of the counter depends on the event on the selected input, the counter is started (but is not reset) at the rising edge of the trigger input, and only the start of the counter is controlled.

15.4.11 Timer interconnection

See the chapter of "14.4.14 Timer Interconnection" for details.

15.4.12 Interrupt and DMA request

The timer can generate an interrupt when an event occurs during operation

- Update event (counter overrun/underrun, counter initialization)
- Trigger event (counter start, stop, internal/external trigger)
- Capture/Compare event

Some internal interrupt events can generate DMA requests, and special interfaces can enable or disable DMA requests.

15.4.13 Debug mode

The TMR2/3/4/5 can be configured in debug mode and choose to stop or continue to work. It depends on the TMRx_STS bit of DBGMCU_APB1F register in DBGMCU module.

15.4.14 Clear OCxREF signal when external events occur

This function is used for output compare and PWM mode.

In one channel, the high level of ETRF input port will reduce the signal of OCxREF to low level, and the OCxCEN bit in capture/compare register TMRx_CCMx is set to 1, and OCxREF signal will remain low until the next update event.

Set TMRx to PWM mode, close the external trigger prescaler, and disable the external trigger mode 2; when ETRF input is high, set OCxCEN=0, and the output OCxREF signal is shown in the figure below.

Figure 51 OCxREF Timing Diagram

Set TMRx to PWM mode, close the external trigger prescaler, and disable the external trigger mode 2; when ETRF input is high, set OCxCEN=1, and the output OCxREF signal is shown in the figure below.

Figure 52 OCxREF Timing Diagram

15.5 Register address mapping

In the following table, all registers of the general-purpose timer are mapped to a 16-bit addressable (address) space.

Table 64 General-purpose Timer Register Address Mapping

Register name	Description	Offset address
TMRx_CTRL1	Control register 1	0x00
TMRx_CTRL2	Control register 2	0x04
TMRx_SMCTRL	Slave mode control register	0x08
TMRx_DIEN	DMA/Interrupt enable register	0x0C
TMRx_STS	State register	0x10
TMRx_CEG	Control event generation register	0x14
TMRx_CCM1	Capture/Compare mode register 1	0x18
TMRx_CCM2	Capture/Compare mode register 2	0x1C
TMRx_CCEN	Enable the capture/compare channel register	0x20
TMRx_CNT	Counter register	0x24
TMRx_PSC	Prescaler register	0x28
TMRx_AUTORLD	Auto reload register	0x2C
TMRx_CC1	Channel 1 capture/compare register	0x34
TMRx_CC2	Channel 2 capture/compare register	0x38
TMRx_CC3	Channel 3 capture/compare register	0x3C
TMRx_CC4	Channel 4 capture/compare register	0x40
TMRx_DCTRL	DMA control register	0x48
TMRx_DMADDR	DMA address register of continuous mode	0x4C
TMR2_OPT	TMR2 option register	0x50
TMR5_OPT	TMR5 option register	0x50

15.6 Register functional description

15.6.1 Control register 1 (TMRx_CTRL1)

Offset address: 0x00

Reset value: 0x0000

Field	Name	R/W	Description
0	CNTEN	R/W	Counter Enable 0: Disable 1: Enable When the timer is configured as external clock, gated mode and encoder mode, it is required to write 1 to the bit by software to start regular work; when it is configured as the trigger mode, it can be written to 1 by hardware.
1	UD	R/W	Update Disable Update event can cause AUTORLD, PSC and CCx to generate the value of update setting. 0: Update event is allowed (UEV) An update event can occur in any of the following situations: The counter overruns/underruns; Set UEG bit; Update generated by slave mode controller. 1: Update event is disabled
2	URSSEL	R/W	Update Request Source Select If interrupt or DMA is enabled, the update event can generate update interrupt or DMA request. Different update request sources can be selected through this bit. 0: The counter overruns or underruns Set UEG bit Update generated by slave mode controller 1: The counter overruns or underruns
3	SPMEN	R/W	Single Pulse Mode Enable When an update event is generated, the output level of the channel can be changed; in this mode, the CNTEN bit will be cleared, the counter will be stopped, and the output level of the channel will not be changed. 0: Disable 1: Enable
4	CNTDIR	R/W	Counter Direction. When the counter is configured in central alignment mode or encoder mode, the bit is read-only. 0: Count up 1: Count down
6:5	CAMSEL	R/W	Center Aligned Mode Select In the center-aligned mode, the counter counts up and down alternately; otherwise, it will only count up or down. Different center-aligned modes affect the timing of setting the output compare interrupt flag bit of the output channel to 1; when the counter is disabled (CNTEN=0), select the center-aligned mode. 00: Edge alignment mode

Field	Name	R/W	Description
			01: Center-aligned mode 1 (the output compare interrupt flag bit of output channel is set to 1 when counting down) 10: Center-aligned mode 2 (the output compare interrupt flag bit of output channel is set to 1 when counting up) 11: Center-aligned mode 3 (the output compare interrupt flag bit of output channel is set to 1 when counting up/down)
7	ARPEN	R/W	Auto-reload Preload Enable When the buffer is disabled, the program modification TMRx_AUTORLD will immediately modify the values loaded to the counter; when the buffer is enabled, the program modification TMRx_AUTORLD will modify the values loaded to the counter in the next update event. 0: Disable 1: Enable
9:8	CLKDIV	R/W	Clock Divide Factor For the configuration of dead time and digital filter, CK_INT provides the clock, and the dead time and the clock of the digital filter can be adjusted by setting this bit. 00: $t_{DTS}=t_{CK_INT}$ 01: $t_{DTS}=2 \times t_{CK_INT}$ 10: $t_{DTS}=4 \times t_{CK_INT}$ 11: Reserved
15:10	Reserved		

15.6.2 Control register 2 (TMRx_CTRL2)

Offset address: 0x04

Reset value: 0x0000

Field	Name	R/W	Description
2:0	Reserved		
3	CCDSEL	R/W	Capture/compare DMA Select 0: Transmit DMA request of CCx when CCx event occurs 1: Transmit DMA request of CCx when an update event occurs
6:4	MMSEL	R/W	Master Mode Signal Select The signals of timers working in master mode can be used for TRGO, which affects the work of timers in slave mode and cascaded with master timer, and specifically affects the configuration of timers in slave mode. 000: Reset; the reset signal of master mode timer is used for TRGO 001: Enable; the counter enable signal of master mode timer is used for TRGO 010: Update; the update event of master mode timer is used for TRGO 011: Compare pulses; when the master mode timer captures/compares successfully ($CCxIFLG=1$), a pulse signal is output for TRGO 100: Compare mode 1; OC1REF is used to trigger TRGO 101: Compare mode 2; OC2REF is used to trigger TRGO 110: Compare mode 3; OC3REF is used to trigger TRGO 111: Compare mode 4; OC4REF is used to trigger TRGO

Field	Name	R/W	Description
7	TI1SEL	R/W	Timer Input 1 Selection 0: TMRx_CH1 pin is connected to TI1 input 1: TMRx_CH1, TMRx_CH2 and TMRx_CH3 pins are connected to TI1 input after exclusive
15:8	Reserved		

15.6.3 Slave mode control register (TMRx_SMCTRL)

Offset address: 0x08

Reset value: 0x0000

Field	Name	R/W	Description
2:0	SMFSEL	R/W	Slave Mode Function Select 000: Disable the slave mode, the timer can be used as master mode timer to affect the work of slave mode timer; if CTRL1_CNTEN=1, the prescaler is directly driven by the internal clock. 001: Encoder mode 1; according to the level of TI1FP1, the counter counts at the edge of TI2FP2. 010: Encoder mode 2; according to the level of TI2FP2, the counter counts at the edge of TI1FP1. 011: Encoder mode 3; according to the input level of another signal, the counter counts at the edge of TI1FP1 and TI2FP2. 100: Reset mode; the slave mode timer resets the counter after receiving the rising edge signal of TRGI and generates the signal to update the register. 101: Gated mode; the slave mode timer starts the counter to work after receiving the TRGI high level signal; it stops the counter when receiving TRGI low level; when receiving TRGI high level signal again, the timer will continue to work; the counter is not reset during the whole period. 110: Trigger mode, the slave mode timer starts the counter to work after receiving the rising edge signal of TRGI. 111: External clock mode 1; select the rising edge signal of TRGI as the clock source to drive the counter to work.
3	Reserved		
6:4	TRGSEL	R/W	Trigger Input Signal Select In order to avoid false edge detection when changing the bit value, it must be changed when SMFSEL=0. 000: Internal trigger ITR0 001: Internal trigger ITR1 010: Internal trigger ITR2 011: Internal trigger ITR3 100: Channel 1 input edge detector TIF_ED 101: Channel 1 post-filtering timer input TI1FP1 110: Channel 2 post-filtering timer input TI2FP2 111: External trigger input (ETRF)
7	MSMEN	R/W	Master/slave Mode Enable 0: Invalid 1: Enable the master/slave mode

15.6.7 Capature/Compare mode register 1 (TMRx_CCM1)

Offset address: 0x18

Reset value: 0x0000

The timer can be configured as input (capture mode) or output (compare mode) by CCxSEL bit. The functions of other bits of the register are different in input and output modes, and the functions of the same bit are different in output mode and input mode. The OCX in the register describes the function of the channel in the output mode, and the ICx in the register describes the function of the channel in the input mode.

Output compare mode:

Field	Name	R/W	Description
1:0	CC1SEL	R/W	Capture/Compare Channel 1 Selection This bit defines the input/output direction and the selected input pin. 00: CC1 channel is output 01: CC1 channel is input, and IC1 is mapped on TI1 10: CC1 channel is input, and IC1 is mapped on TI2 11: CC1 channel is input, and IC1 is mapped on TRC, and only works in internal trigger input Note: This bit can be written only when the channel is closed (TMRx_CCEN register CC1EN=0).
2	OC1FEN	R/W	Output Compare Channel1 Fast Enable 0: Disable 1: Enable This bit is used to improve the response of the capture/compare output to the trigger input event.
3	OC1PEN	R/W	Output Compare Channel1 Preload Enable 0: Preloading function is disabled; write the value of TMRx_CC1 register through the program and it will work immediately. 1: Preloading function is enabled; write the value of TMRx_CC1 register through the program and it will work after an update event is generated. Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. When the preload register is uncertain, PWM mode can be used only in single pulse mode (SPMEN=1); otherwise, the following output compare result is uncertain.
6:4	OC1MOD	R/W	Output Compare Channel1 Mode Configure 000: Freeze The output compare has no effect on OC1REF 001: The output value is high when matching. When the value of counter CNT matches the value CCx of capture/compare register, OC1REF will be forced to be at high level

Field	Name	R/W	Description
			<p>010: The output value is low when matching. When the value of the counter matches the value of the capture/compare register, OC1REF will be forced to be at low level</p> <p>011: Output flaps when matching. When the value of the counter matches the value of the capture/compare register, flap the level of OC1REF</p> <p>100: The output is forced to be low Force OC1REF to be at low level</p> <p>101: The output is forced to be high. Force OC1REF to be at high level</p> <p>110: PWM mode 1 (set to high when the counter value < output compare value; otherwise, set to low)</p> <p>111: PWM mode 2 (set to high when the counter value > output compare value; otherwise, set to low)</p> <p>Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. In PWM modes 1 and 2, the OC1REF level changes when the comparison result changes or when the output compare mode changes from freeze mode to PWM mode.</p>
7	OC1CEN	R/W	<p>Output Compare Channel1 Clear Enable</p> <p>0: OC1REF is unaffected by ETRF input.</p> <p>1: When high level of ETRF input is detected, OC1REF=0</p>
9:8	CC2SEL	R/W	<p>Capture/Compare Channel2 Select</p> <p>This bit defines the input/output direction and the selected input pin.</p> <p>00: CC2 channel is output</p> <p>01: CC2 channel is input, and IC2 is mapped on TI2</p> <p>10: CC2 channel is input, and IC2 is mapped on TI1</p> <p>11: CC2 channel is input, and IC2 is mapped on TRC, and only works in internal trigger input</p> <p>Note: This bit can be written only when the channel is closed (TMRx_CCEN register CC2EN=0).</p>
10	OC2FEN	R/W	Output Compare Channel2 Preload Enable
11	OC2PEN	R/W	Output Compare Channel2 Buffer Enable
14:12	OC2MOD	R/W	Output Compare Channel1 Mode
15	OC2CEN	R/W	Output Compare Channel2 Clear Enable

16 General-purpose timer (TMR9/10/11/12/13/14)

16.1 Introduction

The general-purpose timer takes the time base unit as the core, and has the functions of input capture and output compare, and can be used to measure the pulse width, frequency and duty cycle, and generate the output waveform. It includes a 16-bit auto reload counter (realize count-up).

16.2 Main characteristics of TMR9/12

- (1) Timebase unit
 - Counter: 16-bit counter, count-up
 - Prescaler: 16-bit programmable prescaler
 - Auto reloading function
- (2) Clock source
 - Internal clock
- (3) Timer function
 - Input capture
 - Output compare
 - PWM output mode
 - Forced output mode
 - Single-pulse mode output
- (4) Master/Slave mode controller of timer
 - Timers can be synchronized and cascaded
 - Support multiple slave modes and synchronization signals
- (5) Interrupt event
 - Update event (counter overrun, counter initialization)
 - Trigger event (counter start, stop, internal/external trigger)
 - Input capture
 - Output compare

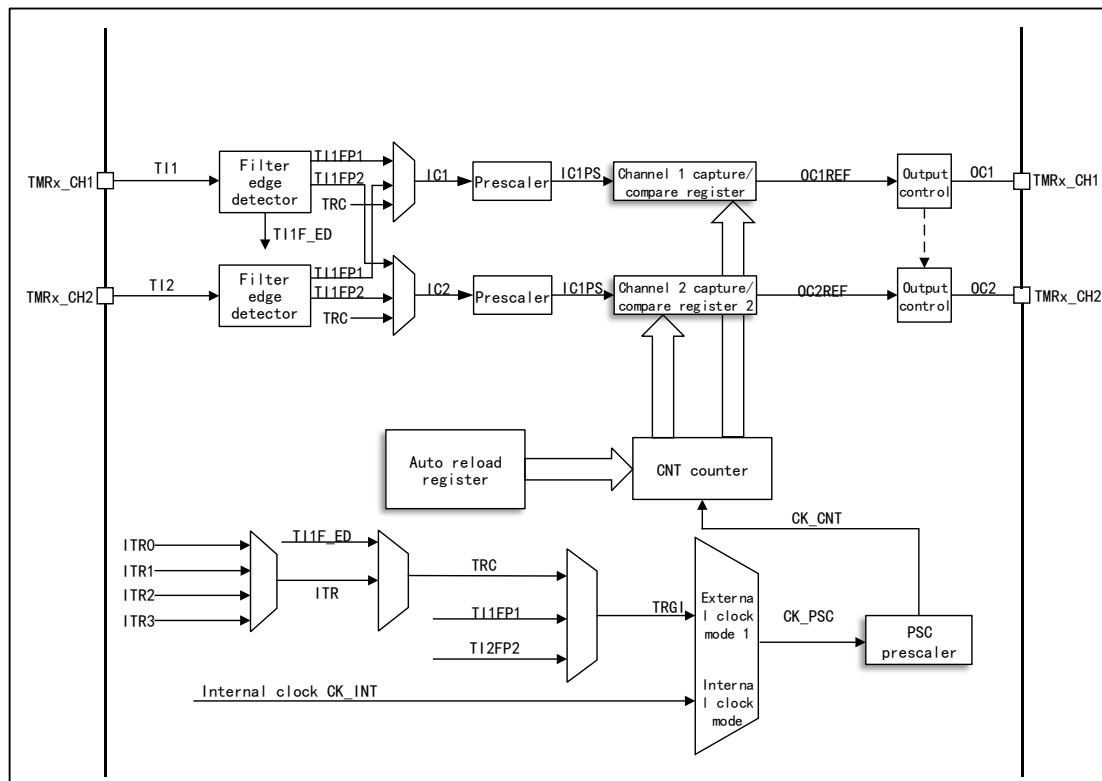

16.3 Main characteristics of TMR10/11/13/14

- (1) Timebase unit
 - Counter: 16-bit counter, count-up
 - Prescaler: 16-bit programmable prescaler
 - Auto reloading function
- (2) Clock source
 - Internal clock

- (3) Timer function
 - Input capture
 - Output compare
 - PWM output mode
 - Forced output mode
 - Single-pulse mode output
- (4) Interrupt and DMA request event
 - Update event (counter overrun, counter initialization)
 - Input capture
 - Output compare

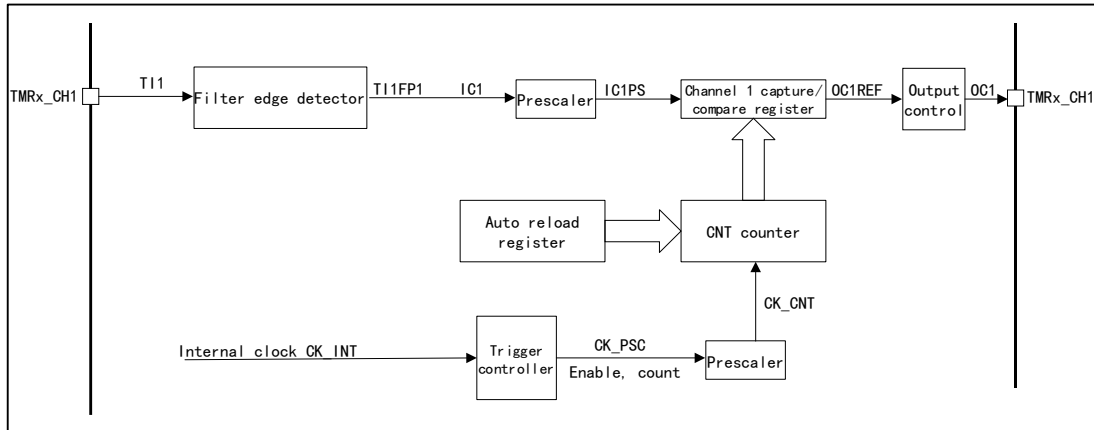

16.4 TMR9/12 structure block diagram

Figure 53 General-purpose Timer TMR9/12 Structure Block Diagram

16.5 TMR10/11/13/14 structure block diagram

Figure 54 General-purpose Timer TMR10/11/13/14 Structure Block Diagram

16.6 Functional description

16.6.1 Clock source

Internal clock

It is TMRx_CLK from RCM, namely the driving clock of the timer; when the slave mode controller is disabled, the clock source CK_PSC of the prescaler is driven by the internal clock CK_INT.

16.6.2 Timebase unit

The time base unit in the general-purpose timer contains three registers

- 16-bit counter register (CNT)
- 16-bit auto reload register (AUTORLD)
- 16-bit prescaler register (PSC)

Counter CNT

The counter in the general-purpose timer can only count-up.

Count-up mode

When the counter is in count-up mode, the counter will count up from 0; every time a pulse is generated, the counter will increase by 1 and when the value of the counter (TMRx_CNT) is equal to the value of the auto reload (TMRx_AUTORLD), the counter will start to count again from 0, a count-up overrun event will be generated, and the value of the auto reload (TMRx_AUTORLD) is written in advance.

When the counter overruns, an update event will be generated. At this time, the

auto reload register and the prescaler register will be updated. The update event can be disabled by UD bit of configuration control register TMRx_CTRL1.

The figure below is Timing Diagram when Division Factor is 1 or 2 in Count-up Mode

Figure 55 Timing Diagram when Division Factor is 1 or 2 in Count-up Mode

Prescaler PSC

The prescaler is 16 bits and programmable, and it can divide the clock frequency of the counter to any value between 1 and 65536 (controlled by TMRx_PSC register), and after frequency division, the clock will drive the counter CNT to count. The prescaler has a buffer, which can be changed during running.

16.6.3 Input capture

Input capture channel

The general-purpose timer has four independent capture/compare channels, each of which is surrounded by a capture/compare register.

In the input capture, the measured signal will enter from the external pin T1/2/3/4 of the timer, first pass through the edge detector and input filter, and then into the capture channel. Each capture channel has a corresponding capture register. When the capture occurs, the value of the counter CNT will be latched in the capture register CCx. Before entering the capture register, the signal will pass through the prescaler, which is used to set how many events to capture at a time.

Input capture application

Input capture is used to capture external events, and can give the time flag to indicate the occurrence time of the event and measure the pulse jump edge events (measure the frequency or pulse width), for example, if the selected edge appears on the input pin, the TMRx_CCx register will capture the current value of the counter and the CCxIFLG bit of the state register TMRx_STS will be set to 1; if CCxIEN=1, an interrupt will be generated.

In capture mode, the timing, frequency, period and duty cycle of a waveform can be measured. In the input capture mode, the edge selection is set to rising edge detection. When the rising edge appears on the capture channel, the first capture occurs, at this time, the value of the counter CNT will be latched in the capture register CCx; at the same time, it will enter the capture interrupt, a capture will be recorded in the interrupt service program and the value will be recorded. When the next rising edge is detected, the second capture occurs, the value of counter CNT will be latched in capture register CCx again, at this time, it will enter the capture interrupt again, the value of capture register will be read, and the cycle of this pulse signal will be obtained through capture.

16.6.4 Output compare

There are eight modes of output compare: freeze, channel x is valid level when matching, channel x is invalid level when matching, flip, force is invalid, force is valid, PWM mode 1 and PWM mode 2, which are configured by OCxMOD bit in TMRx_CCMx register and can control the waveform of output signal in output compare mode.

Output compare application

In the output compare mode, the position, polarity, frequency and time of the pulse generated by the timer can be controlled.

When the value of the counter is equal to that of the capture/compare register, the channel output can be set as high level, low level or flip by configuring the OCxMOD bit in TMRx_CCMx register and the CCxPOL bit in the output polarity TMRx_CCEN register.

When CCxIFLG=1 in TMRx_STS register, if CCxIEN=1 in TMRx_DIEN register, an interrupt will be generated; if CCDSEL=1 in TMRx_CTRL2 register, DMA

request will be generated.

16.6.5 PWM input mode (only applicable to TMR9/12)

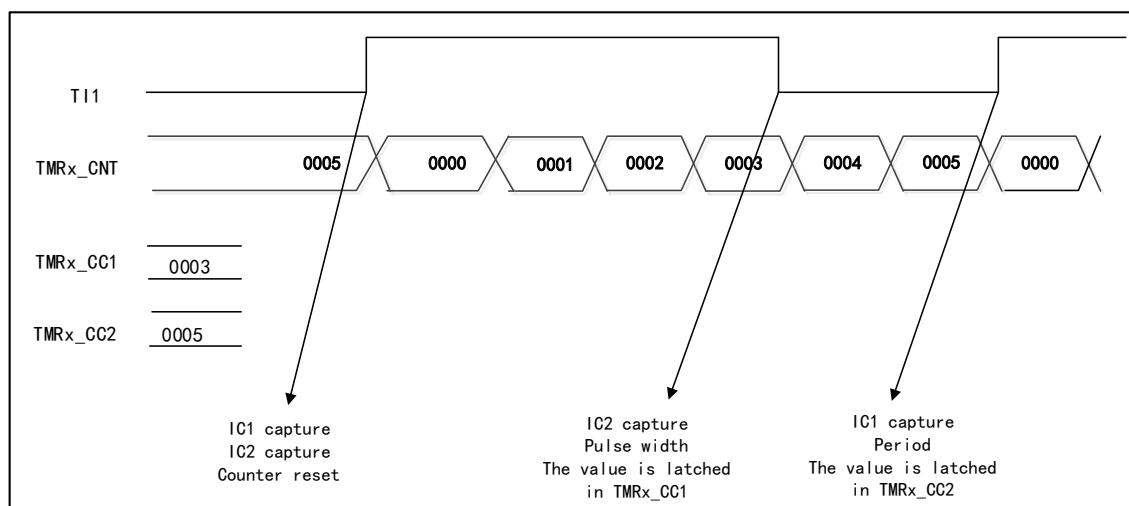

PWM input mode is a particular case of input capture.

In PWM input mode, as only TI1FP1 and TI1FP2 are connected to the slave mode controller, input can be performed only through the channels TMRx_CH1 and TMRx_CH2, which need to occupy the capture registers of CH1 and CH2.

In the PWM input mode, the PWM signal enters from TMRx_CH1, and the signal will be divided into two channels, one can measure the cycle and the other can measure the duty cycle. In the configuration, it is only required to set the polarity of one channel, and the other will be automatically configured with the opposite polarity.

In this mode, the slave mode controller should be configured as the reset mode (SMFSEL bit of TMRx_SMCTRL register).

Figure 56 PWM Input Mode Timing Diagram

16.6.6 PWM output mode

PWM mode is an adjustable pulse signal output by the timer. The pulse width of the signal is determined by the value of the compare register CCx, and the cycle is determined by the value of the auto reload AUTORLD.

PWM output mode contains PWM mode 1 and PWM mode 2; PWM mode 1 and PWM mode 2 can only count-up;

In PWM mode 1, if the value of the counter CNT is less than the value of the compare register CCx, the output level will be valid; otherwise, it will be invalid.

Set the timing diagram in PWM mode 1 when CCx=5, AUTORLD=7.

Figure 57 PWM1 Count-up Mode Timing Diagram

In PWM mode 2, if the value of the counter CNT is less than that of the compare register CCx, the output level will be invalid; otherwise, it will be valid.

Set the timing diagram in PWM mode 2 when CCx=5, AUTORLD=7

Figure 58 PWM2 Count-up Mode Timing Diagram

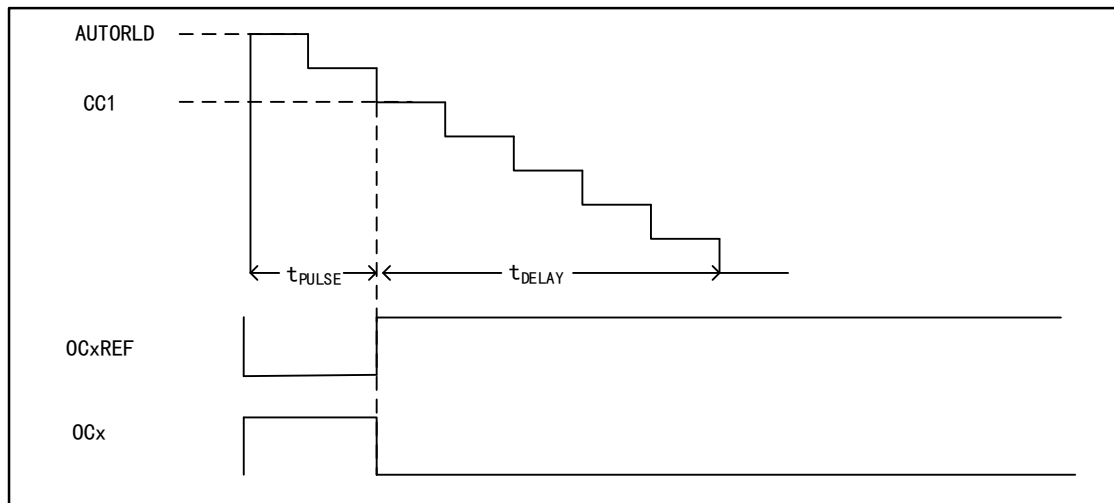

16.6.7 Single-pulse mode

The single-pulse mode is a special case of timer compare output, and is also a special case of PWM output mode.

Set SP MEN bit of TMRx_CTRL1 register, and select the single-pulse mode. After the counter is started, a certain number of pulses will be output before the update event occurs. When an update event occurs, the counter will stop counting, and the subsequent PWM waveform output will no longer be changed.

After a certain controllable delay, a pulse with controllable pulse width is generated in single-pulse mode through the program. The delay time is defined by the value of TMRx_CCx register; in the count-up mode, the delay time is CCx and the pulse width is AUTORLD-CCx; in the count-down mode, the delay time is AUTORLD-CCx and the pulse width is CCx.

Figure 59 Single-pulse Mode Timing Diagram

16.6.8 Forced output mode

In the forced output mode, the comparison result is ignored, and the corresponding level is directly output according to the configuration instruction.

- CCxSEL=00 for TMRx_CCMx register, set CCx channel as output
- OCxMOD=100/101 for TMRx_CCMx register, set to force OCxREF signal to invalid/valid state

In this mode, the corresponding interrupt and DMA request will still be generated.

16.6.9 Debug mode

The TMR9/10/11/12/13/14 can be configured in debug mode and choose to stop or continue to work. It depends on the TMRx_STS bit of DBGMCU_APB1F register or DBGMCU_APB2F register in DBGMCU module.

16.7 TMR9/12 register address mapping

In the following table, all registers of TMR9/12 are mapped to a 16-bit addressable (address) space.

Table 67 TMR9/12 Register Address Mapping

Register name	Description	Offset address
TMRx_CTRL1	Control register 1	0x00
TMRx_SMCTRL	Slave mode control register	0x08
TMRx_DIEN	DMA/Interrupt enable register	0x0C
TMRx_STS	State register	0x10
TMRx_CEG	Control event generation register	0x14
TMRx_CCM1	Capture/Compare mode register 1	0x18

Register name	Description	Offset address
TMRx_CCEN	Capture/Compare enable register	0x20

15:7	Reserved		

16.8.4 State register (TMRx_STS)

Offset address: 0x10

Reset value: 0x0000

Field	Name	R/W	Description
0	UIFLG	RC_W0	Update Event Interrupt Generate Flag 0: Update event interrupt does not occur 1: Update event interrupt occurs When the counter value is reloaded or reinitialized, an update event will be generated. The bit is set to 1 by hardware and cleared by software; update events are generated in the following situations: (1) UD=0 on TMRx_CTRL1 register, and when the value overruns, an update event will be generated; (2) URSEL=0 and UD=0 on TMRx_CTRL1 register, configure UG = 1 on TMRx_CEG register to generate update event, and the counter needs to be initialized by software; (3) URSEL=0 and UD=0 on TMRx_CTRL1 register, generate update event when the counter is initialized by trigger event.
1	CC1IFLG	RC_W0	Capture/Compare Channel1 Interrupt Flag When the capture/compare channel 1 is configured as output:

Field	Name	R/W	Description
			0: No matching occurred 1: The value of TMRx_CNT matches the value of TMRx_CC1 When the capture/compare channel 1 is configured as input: 0: Input capture did not occur 1: Input capture occurred When a capture event occurs, the bit is set to 1 by hardware, and it can be cleared by software or cleared when reading TMRx_CC1 register.
2	CC2IFLG	RC_W0	Capture/Compare Channel2 new Interrupt Flag Refer to STS_CC1IFLG
5:3	Reserved		
6	TRGIFLG	RC_W0	Trigger Event Interrupt Generate Flag 0: Trigger event interrupt did not occur 1: Trigger event interrupt occurred After Trigger event is generated, this bit is set to 1 by hardware and cleared by software.
8:7	Reserved		
9	CC1RCFLG	RC_W0	Capture/compare Channel1 Repetition Capture Flag 0: Repeat capture does not occur 1: Repeat capture occurs The value of the counter is captured to TMRx_CC1 register, and CC1IFLG=1; this bit is set to 1 by hardware and cleared by software only when the channel is configured as input capture.
10	CC2RCFLG	RC_W0	Capture/compare Channel2 Repetition Capture Flag Refer to STS_CC1RCFLG
15:11	Reserved		

16.8.5 Control event generation register (TMRx_CEG)

Offset address: 0x14

Reset value: 0x0000

Field	Name	R/W	Description
0	UEG	W	Update Event Generate 0: Invalid 1: Initialize the counter and generate the update event This bit is set to 1 by software, and cleared by hardware. Note: When an update event is generated, the counter of the prescaler will be cleared, but the prescaler factor remains unchanged. In the count-down mode, the counter reads the value of TMRx_AUTORLD; in center-aligned mode or count-up mode, the counter will be cleared to 0.

Field	Name	R/W	Description
1	CC1EG	W	Capture/Compare Channel1 Event Generation 0: Invalid 1: Capture/Compare event is generated This bit is set to 1 by software and cleared automatically by hardware. If Channel 1 is in output mode: When CC1IFLG=1, if CC1IEN bit is set, the corresponding interrupt will be generated. If Channel 1 is in input mode: The value of the capture counter is stored in TMRx_CC1 register; configure CC1IFLG=1, and if CC1IEN bit is also set, the corresponding interrupt will be generated; at this time, if CC1IFLG=1, it is required to configure CC1RCFLG=1.
2	CC2EG	W	Capture/Compare Channel2 Event Generation Refer to CC1EG description
5:3	Reserved		
6	TEG	W	Trigger Event Generate 0: Invalid 1: Trigger event is generated This bit is set to 1 by software and cleared automatically by hardware.
15:7	Reserved		

16.8.6 Capture/Compare mode register 1 (TMRx_CCM1)

Offset address: 0x18

Reset value: 0x0000

The timer can be configured as input (capture mode) or output (compare mode) by CCxSEL bit. The functions of other bits of the register are different in input and output modes, and the functions of the same bit are different in output mode and input mode. The OCX in the register describes the function of the channel in the output mode, and the ICx in the register describes the function of the channel in the input mode.

Output compare mode:

Field	Name	R/W	Description
1:0	CC1SEL	R/W	Capture/Compare Channel 1 Select This bit defines the input/output direction and the selected input pin. 00: CC1 channel is output 01: CC1 channel is input, and IC1 is mapped on TI1 10: CC1 channel is input, and IC1 is mapped on TI2 11: CC1 channel is input, and IC1 is mapped on TRC, and only works in internal trigger input Note: This bit can be written only when the channel is closed (TMRx_CCEN register CC1EN=0).
2	OC1FEN	R/W	Output Compare Channel1 Fast Enable 0: Disable 1: Enable This bit is used to improve the response of the capture/compare output to the trigger input event.

Field	Name	R/W	Description
3	OC1PEN	R/W	<p>Output Compare Channel1 Preload Enable</p> <p>0: Preloading function is disabled; write the value of TMRx_CC1 register through the program and it will work immediately.</p> <p>1: Preloading function is enabled; write the value of TMRx_CC1 register through the program and it will work after an update event is generated.</p> <p>Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. When the preload register is uncertain, PWM mode can be used only in single pulse mode (SPMEN=1); otherwise, the following output compare result is uncertain.</p>
6:4	OC1MOD	R/W	<p>Output Compare Channel1 Mode Configure</p> <p>000: Freeze The output compare has no effect on OC1REF</p> <p>001: The output value is high when matching. When the value of counter CNT matches the value CCx of capture/compare register, OC1REF will be forced to be at high level</p> <p>010: The output value is low when matching. When the value of the counter matches the value of the capture/compare register, OC1REF will be forced to be at low level</p> <p>011: Output flaps when matching. When the value of the counter matches the value of the capture/compare register, flap the level of OC1REF</p> <p>100: The output is forced to be low Force OC1REF to be at low level</p> <p>101: The output is forced to be high. Force OC1REF to be at high level</p> <p>110: PWM mode 1 (set to high when the counter value < output compare value; otherwise, set to low)</p> <p>111: PWM mode 2 (set to high when the counter value > output compare value; otherwise, set to low)</p> <p>Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. In PWM modes 1 and 2, the OC1REF level changes when the compare result changes or when the output compare mode changes from freeze mode to PWM mode.</p>
7	Reserved

Table 68 Output Control Bit of Standard OCx Channel

CCxEN bit	OCx output state
0	Output is disabled (OCx=0, OCx_EN=0)
1	OCx=OCxREF+polarity, OCx_EN=1

Note: The state of external I/O pin connected to the standard OCx channel depends on the state of the OCx channel and the GPIO and AFIO registers.

16.8.8 Counter register (TMRx_CNT)

Offset address: 0x24

Reset value: 0x0000

Field	Name	R/W	Description
15:0	CNT	R/W	Counter Value

16.8.9 Prescaler register (TMRx_PSC)

Offset address: 0x28

Reset value: 0x0000

Field	Name	R/W	Description
15:0	PSC	R/W	Prescaler Value Clock frequency of counter (CK_CNT)=f _{CK_PSC} /(PSC+1)

16.8.10 Auto reload register (TMRx_AUTORLD)

Offset address: 0x2C

Reset value: 0xFFFF

Field	Name	R/W	Description
15:0	AUTORLD	R/W	Auto Reload Value When the value of auto reload is empty, the counter will not count.

16.8.11 Channel 1 capture/compare register (TMRx_CC1)

Offset address: 0x34

Reset value: 0x0000

Field	Name	R/W	Description
15:0	CC1	R/W	Capture/Compare Channel 1 Value When the capture/compare channel 1 is configured as input mode: CC1 contains the counter value transmitted by the last input capture channel 1 event. When the capture/compare channel 1 is configured as output mode: CC1 contains the current load capture/compare register value Compare the value CC1 of the capture and compare channel 1 with the value CNT of the counter to generate the output signal on OC1. When the output compare preload is disabled (OC1PEN=0 for TMRx_CCM1 register), the written value will immediately affect the output comparison results; If the output compare preload is enabled (OC1PEN=1 for TMRx_CCM1 register), the written value will affect the output compare result when an update event is generated.

16.8.12 Channel 2 capture/compare register (TMRx_CC2)

Offset address: 0x38

Reset value: 0x0000

Field	Name	R/W	Description
15:0	CC2	R/W	Capture/Compare Channel 2 Value Refer to TMRx_CC1

16.9 TMR10/11/13/14 register address mapping

In the following table, all registers of TMR10/11/13/14 are mapped to a 16-bit addressable (address) space.

Table 69 TMR10/11/13/14 Register Address Mapping

Register name	Description	Offset address
TMRx_CTRL1	Control register 1	0x00
TMRx_DIEN	DMA/Interrupt enable register	0x0C
TMRx_STS	State register	0x10
TMRx_CEG	Control event generation register	0x14
TMRx_CCM1	Capture/Compare mode register 1	0x18
TMRx_CCEN	Capture/Compare enable register	0x20
TMRx_CNT	Counter register	0x24
TMRx_PSC	Prescaler register	0x28
TMRx_AUTORLD	Auto reload register	0x2C
TMRx_CC1	Channel 1 capture/compare register	0x34

15:2	Reserved		

16.10.3 State register (TMRx_STS)

Offset address: 0x10

Reset value: 0x0000

Field	Name	R/W	Description
0	UIFLG	RC_W0	Update Event Interrupt Generate Flag 0: Update event interrupt does not occur 1: Update event interrupt occurs When the counter value is reloaded or reinitialized, an update event will be generated. The bit is set to 1 by hardware and cleared by software; update events are generated in the following situations: (1) UD=0 on TMRx_CTRL1 register, and when the value overruns, an update event will be generated; (2) URSEL=0 and UD=0 on TMRx_CTRL1 register, configure UG = 1 on TMRx_CEG register to generate update event, and the counter needs to be initialized by software;
1	CC1IFLG	RC_W0	Capture/Compare Channel1 Interrupt Flag When the capture/compare channel 1 is configured as output: 0: No matching occurred 1: The value of TMRx_CNT matches the value of TMRx_CC1 When the capture/compare channel 1 is configured as input: 0: Input capture did not occur 1: Input capture occurred When a capture event occurs, the bit is set to 1 by hardware, and it can be cleared by software or cleared when reading TMRx_CC1 register.
8:2	Reserved		
9	CC1RCFLG	RC_W0	Capture/compare Channel1 Repetition Capture Flag 0: Repeat capture does not occur 1: Repeat capture occurs The value of the counter is captured to TMRx_CC1 register, and CC1IFLG=1; this bit is set to 1 by hardware and cleared by software only when the channel is configured as input capture.
15:10	Reserved		

16.10.4 Control event generation register (TMRx_CEG)

Offset address: 0x14

Reset value: 0x0000

Field	Name	R/W	Description
0	UEG	W	Update Event Generate 0: Invalid 1: Initialize the counter and generate the update event This bit is set to 1 by software, and cleared by hardware. Note: When an update event is generated, the counter of the prescaler will be cleared, but the prescaler factor remains unchanged. In the count-down mode, the counter reads the value of TMRx_AUTORLD; in center-aligned mode or count-up mode, the counter will be cleared to 0.

Field	Name	R/W	Description
1	CC1EG	W	<p>Capture/Compare Channel1 Event Generation</p> <p>0: Invalid</p> <p>1: Capture/Compare event is generated</p> <p>This bit is set to 1 by software and cleared automatically by hardware.</p> <p>If Channel 1 is in output mode:</p> <p>When CC1IFLG=1, if CC1IEN bit is set, the corresponding interrupt will be generated.</p> <p>If Channel 1 is in input mode:</p> <p>The value of the capture counter is stored in TMRx_CC1 register; configure CC1IFLG=1, and if CC1IEN bit is also set, the corresponding interrupt will be generated; at this time, if CC1IFLG=1, it is required to configure CC1RCFLG=1.</p>
15:2	Reserved		

16.10.5 Capture/Compare mode register 1 (TMRx_CCM1)

Offset address: 0x18

Reset value: 0x0000

The timer can be configured as input (capture mode) or output (compare mode) by CCxSEL bit. The functions of other bits of the register are different in input and output modes, and the functions of the same bit are different in output mode and input mode. The OCx in the register describes the function of the channel in the output mode, and the ICxx in the register describes the function of the channel in the input mode.

Output compare mode:

Field	Name	R/W	Description
1:0	CC1SEL	R/W	<p>Capture/Compare Channel 1 Select</p> <p>This bit defines the input/output direction and the selected input pin.</p> <p>00: CC1 channel is output</p> <p>01: CC1 channel is input, and IC1 is mapped on T11</p> <p>Others: Reserved</p> <p>Note: This bit can be written only when the channel is closed (TMRx_CCEN register CC1EN=0).</p>
2	OC1FEN	R/W	<p>Output Compare Channel1 Fast Enable</p> <p>0: Disable</p> <p>1: Enable</p> <p>This bit is used to improve the response of the capture/compare output to the trigger input event.</p>
3	OC1PEN	R/W	<p>Output Compare Channel1 Preload Enable</p> <p>0: Preloading function is disabled; write the value of TMRx_CC1 register through the program and it will work immediately.</p> <p>1: Preloading function is enabled; write the value of TMRx_CC1 register through the program and it will work after an update event is generated.</p> <p>Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. When the preload register is uncertain, PWM mode can be used only in single pulse mode (SPMEN=1); otherwise, the following output compare result is uncertain.</p>

Field	Name	R/W	Description
6:4	OC1MOD	R/W	<p>Output Compare Channel1 Mode Configure</p> <p>000: Freeze The output compare has no effect on OC1REF</p> <p>001: The output value is high when matching. When the value of counter CNT matches the value CCx of capture/compare register, OC1REF will be forced to be at high level</p> <p>010: The output value is low when matching. When the value of the counter matches the value of the capture/compare register, OC1REF will be forced to be at low level</p> <p>011: Output flaps when matching. When the value of the counter matches the value of the capture/compare register, flap the level of OC1REF</p> <p>100: The output is forced to be low Force OC1REF to be at low level</p> <p>101: The output is forced to be high. Force OC1REF to be at high level</p> <p>110: PWM mode 1 (set to high when the counter value<output compare value; otherwise, set to low)</p> <p>111: PWM mode 2 (set to high when the counter value>output compare value; otherwise, set to low)</p> <p>Note: When the protection level is 3 and the channel is configured as output, this bit cannot be modified. In PWM modes 1 and 2, the OC1REF level changes when the comparison result changes or when the output compare mode changes from freeze mode to PWM mode.</p>
15:7	Reserved		

Input capture mode:

Field	Name	R/W	Description

17 Basic timer (TMR6/7)

17.1 Introduction

The basic timers TMR6 and TMR7 have an unsigned 16-bit counter, auto reload register, prescaler and trigger controller.

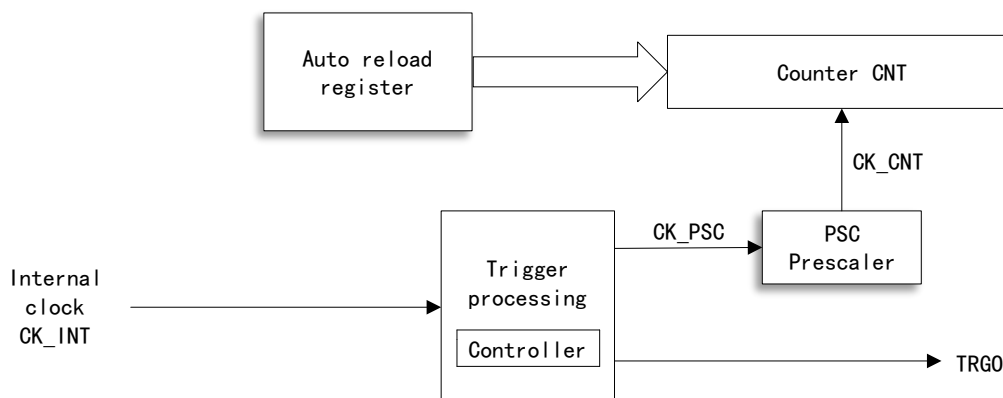

The basic timer provides time reference for general-purpose timer and provides clock for DAC. DMA request can be generated by configuration.

17.2 Main characteristics

- (1) Counter: 16-bit counter, which can only count up
- (2) Prescaler: 16-bit programmable prescaler
- (3) Clock source: There is only internal clock
- (4) Single-pulse mode
- (5) Provide clock for DAC

17.3 Structure block diagram

Figure 60 Basic Timer Structure Block Diagram

17.4 Functional description

17.4.1 Clock source selection

The basic timer is driven by internal clock source TMRx_CLK

Configure the CNTEN bit of TMRx_CTRL1 register to enable the counter; when CNTEN bit is set, the internal clock CK_INT can generate CK_CNT to drive the counter through the controller and prescaler.

17.4.2 Timebase unit

The time base unit in the basic timer contains three registers:

- 16-bit counter register (CNT)
- 16-bit auto reload register (AUTORLD)
- 16-bit prescaler register (PSC)

Counter CNT

The basic timer only has one count mode: count-up

Count-up mode

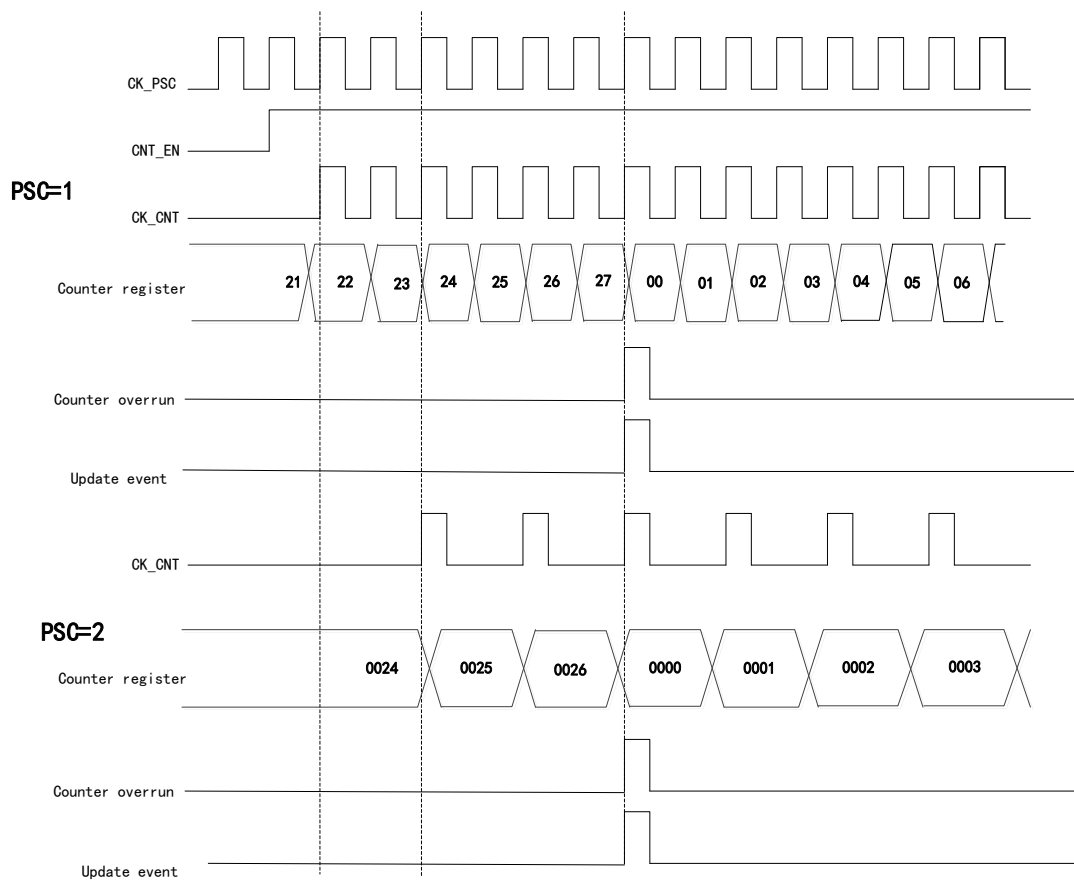

When the counter is in count-up mode, the counter will count up from 0; every time a pulse is generated, the counter will increase by 1 and when the value of the counter (TMRx_CNT) is equal to the value of the auto reload (TMRx_AUTORLD), then the counter will start to count again from 0, a count-up overrun event will be generated, and the value of the auto reload (TMRx_AUTORLD) is written in advance.

Disable the update event and set UD bit of TMRx_CTRL1 register to 1.

Generate the update interrupt or DMA request and set URSEL bit in TMRx_CTRL1 register.

When an update event occurs, both the auto reload register and the prescaler register will be updated.

Figure 61 Timer Timing Diagram, the internal clock division factor is 1 or 2

Prescaler PSC

The prescaler is 16 bits and programmable, and it can divide the clock frequency of the counter to any value between 1 and 65536 (controlled by TMRx_PSC register), and after frequency division, the clock will drive the counter CNT to count. The prescaler has a buffer, which can be changed during running.

17.4.3 Debug mode

The TMR6/7 can be configured in debug mode and choose to stop or continue to work. It depends on the TMRx_STS bit of DBGMCU_APB1F register in DBGMCU module.

17.5 Register address mapping

In the following table, all registers of the basic timer are mapped to a 16-bit addressable (address) space.

Table 71 TMR6/7 Register Address Mapping

Register name	Description	Offset address
TMRx_CTRL1	Control register 1	0x00
TMRx_CTRL2	Control register 2	0x04
TMRx_DIEN	DMA/Interrupt enable register	0x0C
TMRx_STS	State register	0x10
TMRx_CEG	Control event generation register	0x14
TMRx_CNT	Counter register	0x24
TMRx_PSC	Prescaler register	0x28
TMRx_AUTORLD	Auto reload register	0x2C

17.6 Register functional description

17.6.8 Auto reload register (TMRx_AUTORLD)

Offset address: 0x2C

Reset value: 0xFFFF

Field	Name	R/W	Description
15:0	AUTORLD	R/W	Auto Reload Value When the value of auto reload is empty, the counter will not count.

18 Watchdog timer (WDT)

18.1 Introduction

The watchdog is used to monitor system failures caused by software errors. There are two watchdog devices on the chip: independent watchdog and window watchdog, which improve the security, and make the time more accurate and the use more flexible.

The independent watchdog will reset only when the counter is reduced to 0, and the value of refresh counter will not be reset until it is not reduced to 0.

The window watchdog will reset when the counter decreases to 0x3F. When the count value of the counter is before the window value of the configuration register, the refresh counter will also be reset.

18.2 Independent watchdog timer (IWDT)

18.2.1 Introduction

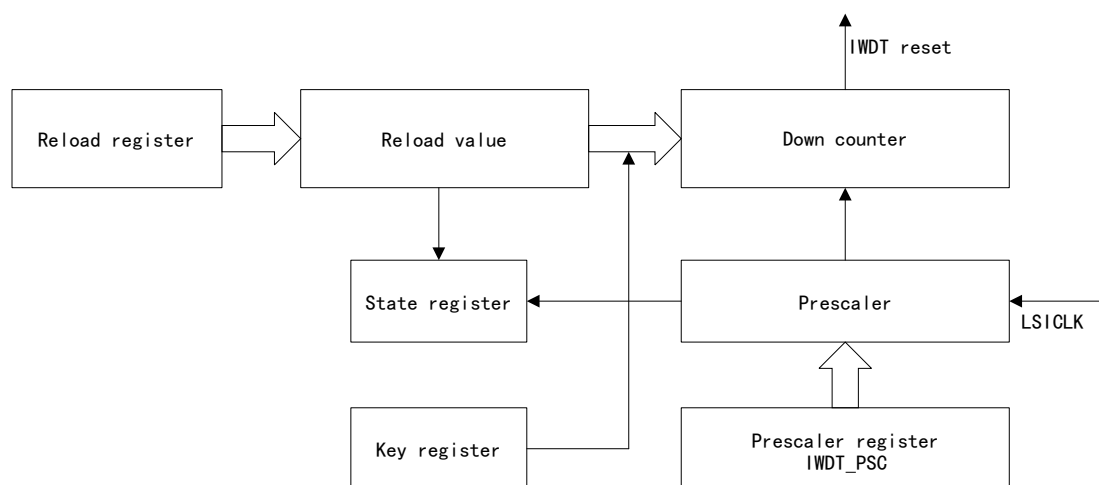

The independent watchdog consists of an 8-bit prescaler IWDT_PSC, 12-bit count-down counter, 12-bit reload register IWDT_CNTRLD, key register IWDT_KEY and state register IWDT_STS.

The independent watchdog has an independent clock source, and even if the master clock fails, it is still valid.

The independent watchdog is applicable to the situations where an independent environment is required but the accuracy requirement is not high.

18.2.2 Structure block diagram

Figure 62 Independent Watchdog Structure Block Diagram

Note: The watchdog function is in the V_{DD} power supply area and can work normally in the shutdown or standby mode.

18.2.3 Functional description

18.2.3.1 Key register

Write 0xCCCC in the key register to enable the independent watchdog, then the counter starts to count down, and when the counter counts to 0x000, a reset will be generated.

Write 0xAAAA in the key register, and the value of the reload register will be reloaded to the counter to prevent the watchdog from resetting.

Write 0X5555 in the key register to rewrite the value of the prescaler register and the reload register.

18.2.3.2 Register access protection

The prescaler register and reload register have the function of write protection. If you want to rewrite these two registers, you need to write 0x5555 in the key register. If you write other value in the key register, the protection of the register will be started again.

Write 0xAAAA to the key register and the write protection function will also be enabled.

18.2.3.3 Hardware watchdog

After the "hardware watchdog" function is enabled, and the system is powered on and reset, the watchdog will run automatically. If 0xAAAA is not written to the key register, reset will be generated after the counter finishes counting.

18.2.3.4 Debug mode

The independent watchdog can be configured in debug mode and choose to stop or continue to work. Depend on DBGMCU_APB1F register IWDT_STS bit.

Table 72 Min/max timeout when LSICLK=28kHz

PSC	Min timeout value	Max timeout value
0	0.125ms	512ms
1	0.25ms	1024ms
2	0.5ms	2048ms
3	1ms	4096ms
44	2ms	8192ms
5	4ms	16384ms
6	8ms	32768ms

18.3 Window watchdog timer (WWDT)

18.3.1 Introduction

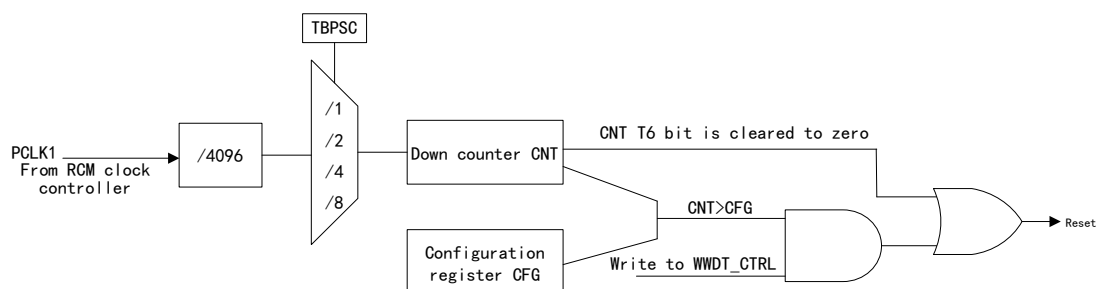

The window watchdog contains a 7-bit free-running down counter, prescaler and control register WWDT_CTRL, configuration register WWDT_CFG and state register WWDT_STS.

The window watchdog clock comes from PCLK1, and the counter clock is obtained from the CK counter clock through frequency division by prescaler (configured by the configuration register).

The window watchdog is applicable when precise timing is needed.

18.3.2 Structure block diagram

Figure 63 Window Watchdog Structure Block Diagram

18.3.3 Functional description

Enable window watchdog timer; the reset conditions are:

- When the counter count is less than 0x40, a reset will be generated.
- The reload counter will be reset before the counter counts to the value of the window register.

After reset, the watchdog is always disabled and it can be enabled only by setting the WWDTEN bit of WWDT_CTRL control register.

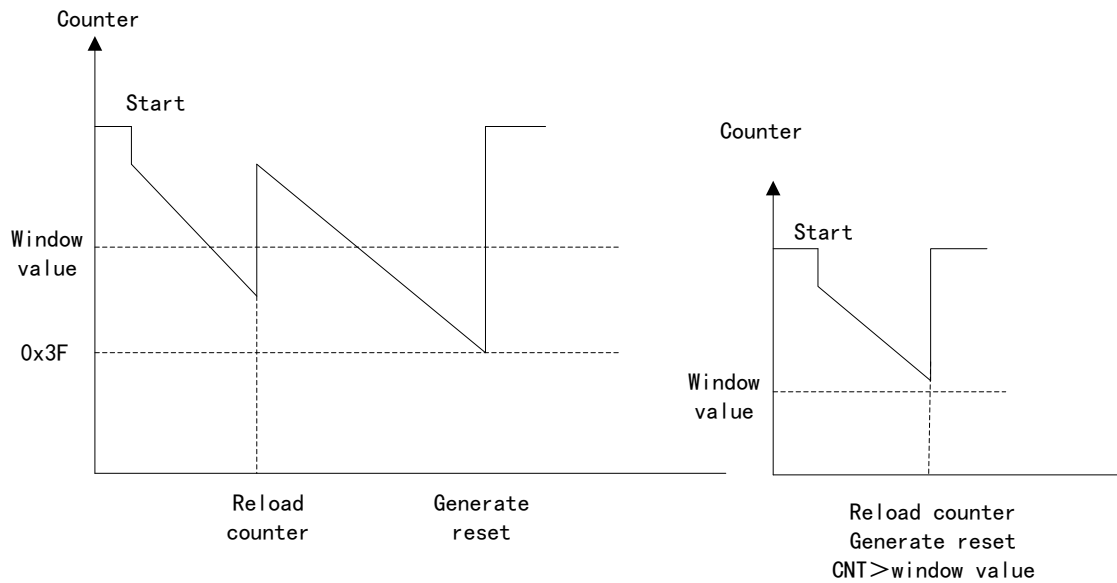

The counter of window watchdog is in free state. When the watchdog is disabled, the counter will continue to count down. The counter must be reloaded between the value of window register and 0x40 to avoid reset.

Setting the EWIEN bit of the configuration register can enable the early wake-up interrupt. When the count reaches 0x40, the interrupt will be generated.

Entering the interrupt service program (ISR) can be used to prevent the window watchdog from resetting. EWIEN interrupt can be cleared by writing 0 in the state register.

The unique window of the window watchdog timer can effectively monitor whether the program is faulty. For example, assuming that the running time of a program segment is T,

Figure 64 Window Watchdog Timing Diagram

The calculation formula of window watchdog timer timeout is as follows:

$$T_{WWDT} = T_{PCLK1} \times 2^{WTB} \times (T[5:0] + 1)$$

Wherein:

- T_{WWDT} : WWDT timeout
- T_{PCLK1} : Clock cycle of APB1 (in ms)

Minimum/Maximum timeout when PCLK1=36MHZ:

Table 73 Min/Max Timeout when PCLK1=36MHZ

WTB	Min timeout value	Max timeout value
0	136.53μs	8.74ms
1	273.07μs	17.48ms
2	546.13μs	34.95ms
3	1092.27μs	69.91ms

19 Real-time clock (RTC)

19.1 Full name and abbreviation description of terms

Table 76 Full name and abbreviation description of terms

Full name in English	English abbreviation
Second	SEC
Alarm	ALR
Prescaler	PSC

19.2 Introduction

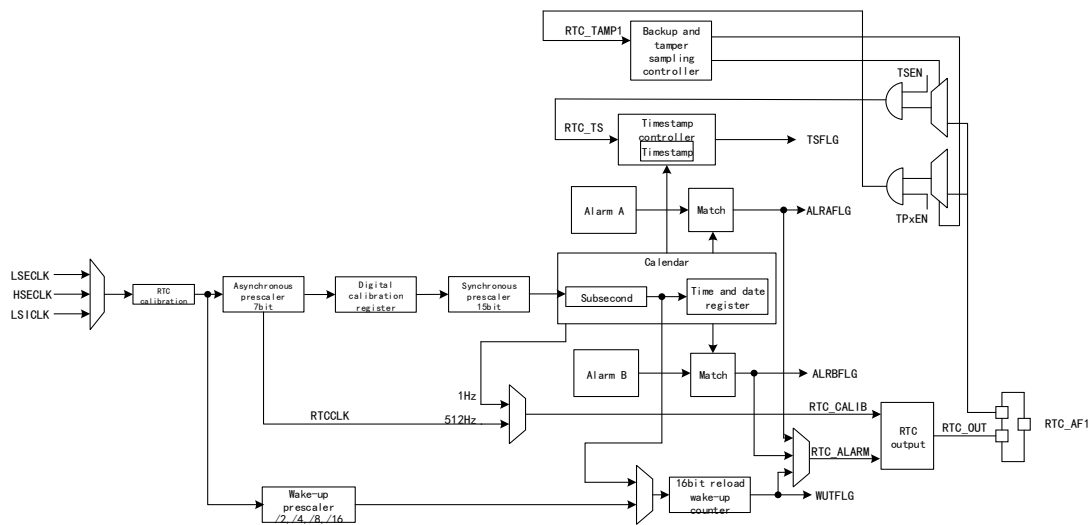

It has sub-second, time and date registers with BCD coding, as well as corresponding alarm registers, and can realize timestamp function together with external pins. It supports clock calibration function and time compensation.

19.3 Main characteristics

- (1) Timebase unit
- (2) Clock calibration
- (3) Subsecond, time and date
- (4) Time error compensation
- (5) Alarm (subsecond, time and date mask)
- (6) Timestamp
- (7) Tamper detection
- (8) 2 kinds of RTC outputs
- (9) Backup domain
- (10) Multiple interrupt control
- (11) Automatic wakeup of low power

19.4 Structure block diagram

Figure 65 RTC Structure Block Diagram

Note:

- (1) Alternate function output: RTC_OUT is output in one of the following two forms
 - RTC_CALIB: This output is enabled through CALOEN bit of RTC_CTRL register, and when the frequency of LSECLK is 32.768kHz, the clock output is 512Hz or 1Hz.
 - RTC_ALARM: This output, Alarm A, is enabled through OUTSEL bit of RTC_CTRL register.
- (2) Alternate function input:
 - RTC_TS: Timestamp event
 - RTC_TAMP1: Tamper event detection 1
- (3) The multiplexing function of RTC_AF1 is connected to PC13 respectively

19.5 Functional description

19.5.1 Timebase unit

Clock source

RTC has three clock sources:

- External LSECLK crystal oscillator
- External HSECLK crystal oscillator
- Internal LSICLK

Select different clock sources by configuring the register of the clock controller CCM.

Prescaler

When backup power supply is used, the power consumption of RTC peripherals should be as low as possible. Considering power consumption, RTC internally adopts dual prescaler, 7-bit asynchronous prescaler APSC and 15-bit synchronous prescaler SPSC.

RTCCLK first passes through the asynchronous prescaler, and the clock after frequency division reaches the synchronous prescaler. Two prescalers can be reasonably configured to generate a 1Hz clock for date.

When the prescaler is used, it is suggested that the asynchronous prescaler should be adjusted as high as possible to reduce power consumption.

The synchronous prescaled value can also be used as the reload value of the subsecond counter.

19.5.2 Clock calibration

Clock synchronization

RTC can realize clock synchronization according to external high-precision clock and the register RTC_SHIFT. The deviation between RTC clock and external clock is detected mainly by acquiring the timestamps of subsecond time period twice. Since the synchronous prescaled value is used as the reload value of the subsecond counter, and the SFSEC bit of register RTC_SHIFT is used in the subsecond counter, the SFSEC bit can be adjusted to finely tune the RTC clock and increase or decrease several cycles artificially.

Reference clock

RTC has internal reference clock detection, which can be used to compensate the deviation of external LSECLK crystal oscillator. Set RCLKDEN bit to enable the reference clock detection, compare the external 50Hz or 60Hz reference clock with the internal 1Hz clock of RTC through RTC_REFIN pin, and through this mechanism, the 1Hz clock after LSECLK frequency division is automatically compensated.

After the reference clock detection is enabled, the synchronous and asynchronous prescaler of the clock unit must be configured as the default value.

The reference clock detection cannot be used simultaneously with the clock synchronization, and it should be disabled in standby mode.

RTC coarse digital calibration

RTC_DCAL register can be configured as positive or negative calibration to update the date in advance or with delay, so the effective frequency can be adjusted.

RTC precision digital calibration

RTC uses 2^{20} RTCCLK as a calibration cycle by default. In addition, 2^{19} and 2^{18} RTCCLK can be set as a calibration cycle through the registers CALW16 and CALW8. When LSECLK is used as RTCCLK clock source, the calibration cycle

of RTC is 32s, 16s, 8s.

- 16s calibration cycle; the hardware sets RECALF[0] to "0"
- 8s calibration cycle; the hardware sets RECALF[1:0] to "00"

Take 32s calibration cycle as an example, the calibration mechanism is to add or reduce some RTCCLK signals in the calibration cycle.

- When RECALF is used, RECALF RTCCLK are reduced every 2^{20} RTCCLK
- When ICALFEN is used and ICALFEN=1, one RTCCLK is added every 2^{11} RTCCLK
- When RECALF is used and ICALFEN, $(512 * ICALFEN - RECALF)$ RTCCLK are added every 2^{20} RTCCLK

19.5.3 RTC write protection

In order to prevent counting exception caused by accidental write, RTC register adopts write protection mechanism. Only when the write protection is removed, can the register with write protection function be operated.

After power-on, RTC register will enter the write protection state and the protection cannot be removed by system reset. The write protection can be removed by writing special keywords '0xCA' and '0x53' to the register RTC_WRPROT. If the wrong keyword is written, RTC will immediately enable write protection.

19.5.4 Date register

RTC has subsecond, time and date shadow registers encoded by BCD, which are RTC_SUBSEC, RTC_TIME and RTC_DATE respectively. The current date can be obtained by accessing the shadow register or obtained directly from the date register. The time system of 24 hours and 12 hours can be selected by TIMEFCFG bit of configuration register RTC_CTRL.

RTC updates the shadow register every two RTCCLK cycles, and sets the flag bit RSFLG. When waking up from stop or standby mode, generally the shadow register will not be updated, which requires waiting for 1-2 RTCCLK cycles. The reset of shadow register is caused by system reset.

The shadow register is synchronized with f_{APB1} .

The way to read the date can be selected by RCMCFG bit of configuration register RTC_CTRL.

RCMCFG=0, read the date from the shadow register

In this mode, it is recommended that f_{APB1} should be greater than $7 * f_{RTCCLK}$. If f_{APB1} is too small, to ensure the normal reading of date value, it is required to read the shadow register twice. If the date obtained twice is the same, the date is read successfully.

After the shadow register is updated, the flag bit RSFLG will be set. The software can read the date only after the bit RSFLG is set. Every time the date is read, the RSFLG flag should be cleared manually.

When waking up from stop or standby mode, since the shadow register is not updated, the RSFLG flag should be cleared immediately.

RCMCFG=1, read the date from the date register

When f_{APB1} is less than $7 \cdot f_{RTCCLK}$ or the system is woken from low-power mode, it is recommended to read the date directly from the date register.

If RSFLG flag bit is not set to 1 when reading the date just at the stage of date register change, it is required to read the date twice. Therefore, it is also recommended to read the date register twice. When the read date value is the same twice, it means that the date is read successfully.

19.5.5 Time compensation

Due to seasonal changes, time compensation is sometimes needed to make it more suitable for daily needs. RTC is integrated with time compensation unit and its summer time flag. Users can choose whether to turn on time compensation according to their own needs.

By setting STCCFG bit of the register RTC_CTRL, the summer time will increase by 1 hour; by setting WTCCFG bit of the register RTC_CTRL, the winter time will decrease by 1. BAKP flag is used to record whether the summer time is set.

19.5.6 Programmable alarm

As a real-time clock, RTC integrates alarm function, and it runs mainly through alarm configuration register and alarm mask, in combination with date register.

Configure the alarm and alarm mask through the register RTC_ALRMA/RTC_ALRMAS and RTC_ALRMB/RTC_ALRMBSS, and the alarm mask informs RTC to pay attention to the time period of the alarm. After the alarm function is enabled, the alarm will be triggered only when the concerned time period reaches the set value. At this time, the alarm flag is set. If the alarm interrupt is enabled, the interrupt processing will be triggered.

Select "seconds" as the time period of the alarm, and only when the synchronous prescaler value is greater than 3, can the alarm operate normally.

19.5.7 Timestamp

RTC supports timestamp function and the RTC_TS pin works together with the timestamp register.

The timestamp polarity is detected through TSETECFG bit of the register RTC_CTRL. When RTC_TS pin recognizes the external timestamp edge signal,

RTC will automatically latch the current date in the subsecond, time and date timestamp registers, and the timestamp flag bit TSFLG will be set to 1. If the timestamp interrupt is enabled, the timestamp interrupt processing will be triggered.

When TSFLG flag bit is set to 1, and a timestamp event occurs, the timestamp will overrun, and the flag bit TSOVRFLG will be set to 1. If a timestamp event is detected once TSFLG flag is cleared, both TSFLG and TSOVRFLG flags will be set to 1.

TAMPER multiplexing function

RTC_TAMP1 multiplexing function can be mapped to RTC_AF1, and it is determined by TP1MSEL bit of RTC_TACFG register. After TP1MSEL is modified, clear TP1EN bit to zero to avoid accidental setting of TP1FLG.

19.5.8 Backup domain

After the main power supply V_{DD} is powered off, the backup domain register will be powered by V_{BAT} automatically. System resetting, NRST pin resetting, and resetting after the low mode is waken up will not affect the backup domain register. When V_{BAT} is powered off or tamper event occurs, the backup domain register will be reset.

The backup domain register can be used to cache user data, and can be used as a state flag to realize some function application by using the characteristics that the system reset data will remain unchanged.

19.5.9 Tamper detection

Tamper detection is a kind of data self-destruction protection device to prevent data leakage caused by tamper. Through the hardware circuit design, the tamper detection signal is sent to the tamper detection pin.

Tamper detection has multiple tamper detection pins, and each pin is enabled by a register bit separately. In order to detect real tamper events better, signal filtering can be configured, and tamper detection polarity can be configured for each pin.

Tamper detection polarity

The low level/rising edge and high level/falling edge can be selected as tamper detection polarity through TPxAL bit in the register RTC_TACFG.

Tamper signal filter

TPSFSEL bit of the register RTC_TACFG is used to configure the sampling frequency of tamper detection, and TPFSEL bit of RTC_TACFG is used to configure after how many valid tamper signals are detected continuously, an

tamper event can be generated.

In particular, if an tamper signal has been generated on the tamper detection pin before the tamper detection pin is enabled, an tamper event will be immediately generated on the enabled tamper detection pin.

Tamper timestamp

At some times, in order to record the tamper detection events, RTC can latch the current tamper timestamp and this function can be enabled quickly through TPTSEN bit of the register RTC_TACFG, not needing to enable the timestamp function additionally.

19.5.10 Automatic wake-up

Compared with RTC alarm, the hardware structure of the automatic wake-up is simpler, and it has no complicated configuration process of RTC alarm, so it is a good scheme to wake up the low power consumption.

There is a 16-bit self-decrement reload counter in RTC, and it is used to wake up the device automatically.

The clock of this counter is selected by WUCLKSEL bit of the register RTC_CTRL, and by selecting different clocks, the automatic wake-up cycle can be configured from 122 μ s to 36h. First turn off the automatic wake-up, namely, clear WUTEN; when WUTWFLG flag bit is set to 1, configure WUCLKSEL bit of the RTC_CTRL register and the reload register RTC_AUTORLD.

When the counter decreases to 0, a wake-up event will be generated, WUTFLG flag bit will be set to 1, and before entering the next round of automatic wake-up, this flag bit must be cleared.

19.5.11 RTC output

RTC output transmits the internal RTC calibration clock, alarm signal, and automatic wake-up signal to the outside.

RTC calibration clock

Calibration clock output is generally used to observe the accuracy of RTC clock source, and the observed value is used to calibrate the clock source. 512Hz and 1Hz signal output sources can be selected through CALOSEL bit of RTC_CTRL register, and CALOEN bit of RTC_CTRL register can enable the calibration output.

Calibration multiplexing function output

When CALOEN bit of RTC_CTRL register is set, RTC_AF1 will enable the calibration multiplexing function.

Alarm and automatic wake-up signal

When the alarm or automatic wake-up is running, these two events can be output as pulse signals. OUTSEL bit of RTC_CTRL register is used to select the signal output source, and POLCFG bit is used to configure the output polarity.

19.6 Register address mapping

Table 77 RTC Register Address Mapping

Register name	Description	Offset address
RTC_TIME	RTC time register	0x00
RTC_DATE	RTC date register	0x04
RTC_CTRL	RTC control register	0x08
RTC_STS	RTC state register	0x0C
RTC_PSC	RTC prescaler register	0x10
RTC_AUTORLD	RTC auto reload register	0x14
RTC_DCAL	RTC coarse calibration register	0x18
RTC_ALRMA	RTC alarm A register	0x1C
RTC_ALRMB	RTC alarm B register	0x20
RTC_WRPROT	RTC write protection register	0x24
RTC_SUBSEC	RTC subsecond register	0x28
RTC_SHIFT	RTC shift register	0x2C
RTC_TSTIME	RTC timestamp time register	0x30
RTC_TSDATE	RTC timestamp date register	0x34
RTC_TSSUBSEC	RTC timestamp subsecond register	0x38
RTC_CAL	RTC calibration register	0x3C
RTC_TACFG	RTC tamper and multiplexing configuration register	0x40
RTC_ALRMASS	RTC alarm A subsecond register	0x44
RTC_ALRMBSS	RTC alarm B subsecond register	0x48
RTC_BAKPx	RTC backup register	0x50-0x9C

19.7 Register functional description

19.7.1 RTC time register (RTC_TIME)

RTC_TIME is time shadow register, and this register can be written only in initialization mode to be put in write protection state.

Offset address: 0x00

Reset value of backup domain: 0x0000 0000

System reset: RCMCFG =0: 0x0000 0000; RCMCFG =1: 0xXXXX XXXX

31:24	Reserved		

19.7.4 RTC state register (RTC_STS)

This register (except RTC_STS[13:8] bit) is in write protection state.

Offset address: 0x0C

Reset value of backup domain: 0x0000 0007

System reset: 0xXXXX XXXX

Field	Name	R/W	Description
0	ALRAWFLG	R	Alarm A Write Occur Flag When ALRAEN=0 for RTC_CTRL, the value of alarm A will change and this bit will be set to 1 by hardware; this bit will be cleared by hardware in initialization mode. 0: The alarm A cannot be updated 1: The alarm A can be updated
1	ALRBWFLG	R	Alarm B Write Occur Flag When ALRBEN=0 for RTC_CTRL, the value of alarm A will change and this bit will be set to 1 by hardware; this bit will be cleared by hardware in initialization mode. 0: The alarm B cannot be updated 1: The alarm B can be updated
2	WUTWFLG	R	Wakeup Timer Write Occur Flag When WUTEN=0 and the value of wake-up timer can be changed, this bit can be set by hardware. 0: It is not allowed to update the wake-up timer configuration 1: It is allowed to update the wake-up timer configuration

Field	Name	R/W	Description
3	SOPFLG	R	Shift Operation Pending Occur Flag 0: Not occur 1: Occurred When a shift operation is generated by writing to RTC_SHIFT register, this bit will be set to 1 by hardware immediately. After corresponding shift operation is performed, this bit will be cleared by software. It is invalid to write to SOPFLG.
4	INITSFLG	R	Initialization State Occur Flag When the "year" field in the date is not "0", this bit will be set by hardware. 0: Not occur 1: Occurred
5	RSFLG	RC_W0	Registers Synchronization Occur Flag When the content in the date register is copied to the shadow registers (RTC_SUBSEC, RTC_TIME and RTC_DATE), this bit is set to 1 by hardware; when shifting operation is pending (SOPFLG=1) or is in the mode that the shadow register is ignored (RCMCFG=1), this bit is cleared by hardware in initialized mode; or this bit can be cleared by software. This bit is cleared by hardware/software in initialization mode. 0: Not synchronized 1: Synchronized
6	RINITFLG	R	Register Initialization Occur Flag This bit is set to "1", RTC is in initialization state, and the time, date and prescaler registers can be updated. 0: Cannot be initialized 1: Initialized
7	INITEN	R/W	Initialization Mode Enable 0: Free run mode 1: Initialization mode; it is used to program RTC_TIME, RTC_DATE and RTC_PSC. The counter stops counting, and after INITEN is reset, the counter will start counting from a new value.
8	ALRAFLG	RC_W0	Alarm A Match Occur Flag When RTC_TIME and RTC_DATE match the alarm A register RTC_ALRMA, this flag is set by hardware. This flag can be cleared by writing 0 by software.
9	ALRBFLG	RC_W0	Alarm B Match Occur Flag When RTC_TIME and RTC_DATE match the alarm B register RTC_ALRMB, this flag is set by hardware. This flag can be cleared by writing 0 by software.
10	WUTFLG	RC_W0	Wakeup Timer Occur Flag When the auto refresh counter counts to 0, this bit will be set to 1 by hardware; it is cleared by writing 0 by software. Clear this flag 1.5 RTCCLK cycles before WUTFLG is set to 1 again.
11	TSFLG	RC_W0	Flag for occurrence of timestamp (Time Stamp Occur Flag) When a timestamp event occurs, this flag is set to 1 by hardware; it is cleared by writing 0 by software.

Field	Name	R/W	Description
12	TSOVRFLG	RC_W0	Time Stamp Overflow Occur Flag When TSFLG=1 and a timestamp event is generated, this flag bit is set to 1 by hardware; it is cleared by writing 0 by software. It is recommended to clear this bit after TSFLG flag bit is cleared.
13	TP1FLG	RC_W0	RTC_TP1FLG Detection Occur Flag When a tamper event is detected in RTC_TP1FLG input, this flag is set to 1 by hardware, and it can be cleared by writing 0 by software.
14	TP2FLG	RC_W0	RTC_TP2FLG Detection Occur Flag When a tamper event is detected in RTC_TP2FLG input, this flag is set to 1 by hardware, and it can be cleared by writing 0 by software.
15	Reserved		
16	RCALPFLG	R	Recalibration Pending Occur Flag When the software writes to RTC_CAL, this bit is set to 1 automatically, and the RTC_CAL register is locked. This bit will return 0 when other new calibration setting is performed.
31:17	Reserved		

19.7.5 RTC prescaler reegister (RTC_PSC)

The register can only be written in the initialization mode, and the initialization must be completed by two independent write accesses, which is in write protected state.

19.7.15 RTC timestamp subsecond register (RTC_TSSUBSEC)

This register is valid only when TSFLG bit of RTC_STS register is set to 1. When TSFLG bit is reset, the content of this register will be cleared.

Offset address: 0x38

Reset value of backup domain: 0x0000 0000

System reset: 0xXXXX XXXX

Field	Name	R/W	Description
15:0	SUBSEC	R	Sub Second Value Setup When a timestamp event occurs, SUBSEC [15:0] is the value in synchronous prescaler counter.
31:16	Reserved		

19.7.16 RTC precision calibration register (RTC_CAL)

This register is in write protection state.

Offset address: 0x3C

Reset value of backup domain: 0x0000 0000

System reset: 0xXXXX XXXX

Field	Name	R/W	Description
8:0	RECALF	R/W	Reduced Calibration Frequency Reduced date frequency: Mask RECALF pulses within 2 ²⁰ RTCCLK pulses (32sec if the output frequency is 32768 Hz) and the date frequency will be reduced (the resolution is 0.9537 ppm). Increased date frequency: It takes effect at the same time with ICALFEN
12:9	Reserved		
13	CAL16CFG	R/W	16 Second Calibration Cycle Period Configure When CAL16CFG is set to 1, 16-second calibration cycle is used, and it cannot be set to 1 at the same time with CAL8CFG bit. When CAL16CFG=1, RECALF [0] is always 0.
14	CAL8CFG	R/W	8 Second Calibration Cycle Period Configure When CAL8CFG is set to 1, 8-second calibration cycle is used, and it cannot be set to 1 at the same time with CAL16CFG bit. When CAL8CFG=1, RECALF [1:0] is always 00.
15	ICALFEN	R/W	Increase Calibration Frequency Enable 0: RTCCLK pulse is not increased 1: One RTCCLK pulse is increased (the frequency increases by 488.5 ppm) every 2 ¹¹ pulses It takes effect at the same time with RECALF, and when the resolution is high, the date frequency will be reduced. If the input frequency is 32768Hz, the number of RTCCLK pulses added in the 32-second window is determined by the following formula: (512*ICALFEN)–RECALF。
31:16	Reserved		

19.7.17 RTC tamper and multiplexing configuration register (RTC_TACFG)

Offset address: 0x40

Reset value of backup domain: 0x0000 0000

System reset: 0xXXXX XXXX

Field	Name	R/W	Description
0	TP1EN	R/W	RTC_TAMP1 Input Detection Enable 0: Disable 1: Enable
1	TP1ALCFG	R/W	RTC_TAMP1 Input Active Level Configure When TPFCSEL!=00, this bit determines that RTC_TAMP1 will trigger an tamper detection event when the input maintains high/low level. 0: Low level 1: High level When TPFCSEL=00, this bit determines that RTC_TAMP1 triggers an tamper detection event when the input is on rising/falling edge. 0: Rising edge 1: Falling edge
2	TPIEN	R/W	Tamper Interrupt Enable

Field	Name	R/W	Description
			0: Disable 1: Enable
6:3	Reserved		
7	TPTSEN	R/W	Tamper Detection Event Timestamp Enable This bit determines whether the timestamp generated by the tamper detection event is saved 0: Not saved 1: Saved This bit is still valid when TSEN=0 for RTC_CTRL register.
10:8	TPSFSEL	R/W	Tamper Sampling Frequency Select These bits determine the sampling frequency of each input of RTC_TAMPx. 0x0: RTCCLK/32768 0x1: RTCCLK/16384 0x2: RTCCLK/8192 0x3: RTCCLK/4096 0x4: RTCCLK/2048 0x5: RTCCLK/1024 0x6: RTCCLK/512 0x7: RTCCLK/256
12:11	TPFCSEL	R/W	RTC_TAMPx Filter Count Select These bits determine the number of sampling times after which the tamper event is activated on specific level (TAMP*TRG). TPFCSEL is valid for each input of RTC_TAMPx. 0x0: Activate the tamper event on the edge where RTC_TAMPx input is converted into valid level 0x1: Continuous sampling twice 0x2: Continuous sampling for four times 0x3: Continuous sampling for eight times
14:13	TPPRDUSEL	R/W	RTC_TAMPx Precharge Duration Select These bits determine the number of RTCCLK cycles which are enabled by pull-up resistor before sampling; which is valid in each input of RTC_TAMPx. 0x0: 1 0x1: 2 0x2: 4 0x3: 8
15	TPPUDIS	R/W	RTC_TAMPx Pull-up Function Disable This bit determines whether all RTC_TAMPx pins are precharged before sampling. 0: Enable (internal pull-up is enabled) 1: Disable
16	TP1MSEL	R/W	RTC_TAMP1 Mapping Select 0: RTC_AF1 is used as RTC_TAMP1 1: No effect Note: When this bit is changed, TP1EN must be reset, so as to avoid unnecessary setting of TP1FLG.

Field	Name	R/W	Description
17	TSMSEL	R/W	Timestamp Mapping Select 0: RTC_AF1 is used as timestamp 1: No effect
18	ALRMOT	R/W	RTC_ALARM Output Type Configure 0: Open-drain output 1: Push-pull output
31:19	Reserved		

19.7.18 RTC alarm A subsecond register (RTC_ALRMASS)

This register can be written only when ALRAEN bit of RTC_CTRL is reset or in initialization mode, and it will be in write protection state.

This register is in write protection state.

Offset address: 0x44

Reset value of backup domain: 0x0000 0000

System reset: 0xXXXX XXXX

Field	Name	R/W	Description
14:0	SUBSEC	R/W	Sub Second Value Setup The subsecond value is compared with the value in the synchronous prescaler counter to determine whether to activate the alarm A, and only the bits from 0 to MASKSEL-1 are compared.
23:15	Reserved		
27:24	MASKSEL	R/W	Mask the Most-significant Bits Starting at This Bit Select 0x0: Alarm A is not compared. The alarm is set when the second unit increases by 1 0x1: When comparing with alarm A, SUBSEC[14:1] is not involved, and only SUBSEC[0] is involved 0x2: When comparing with alarm A, SUBSEC[14:2] is not involved, and only SUBSEC[1:0] is involved 0x3: When comparing with alarm A, SUBSEC[14:3] is not involved, and only SUBSEC[2:0] is involved ... 0xC: When comparing with alarm A, SUBSEC[14:12] is not involved, and only SUBSEC[11:0] is involved 0xD: When comparing with alarm A, SUBSEC[14:13] is not involved, and only SUBSEC[12:0] is involved 0xE: When comparing with alarm A, SUBSEC[14] is not involved, and only SUBSEC[13:0] is involved 0xE: When comparing the alarm A, 15 SUBSEC bits all take part in, and the alarm can be activated only when all of them match. The synchronous counter overrun bit (Bit 15) is never compared. This bit is not 0 only after shift operation.
31:28	Reserved		

19.7.19 RTC alarm B subsecond register (RTC_ALRMBSS)

This register can be written only when ALRBEN bit of RTC_CTRL is reset or in initialization mode, and it will be in write protection state.

Offset address: 0x48

Reset value of backup domain: 0x0000 0000

System reset: 0xXXXX XXXX

Field	Name	R/W	Description
14:0	SUBSEC	R/W	Sub Second Value Setup The subsecond value is compared with the value in the synchronous prescaler counter to determine whether to activate the alarm B, and only the bits from 0 to MASKSEL-1 are compared.
23:15	Reserved		
27:24	MASKSEL	R/W	Mask the Most-significant Bits Starting at This Bit Select 0x0: Alarm B is not compared. The alarm is set when the second unit increases by 1 0x1: When comparing with alarm B, SUBSEC[14:1] is not involved, and only SUBSEC[0] is involved 0x2: When comparing with alarm B, SUBSEC[14:2] is not involved, and only SUBSEC[1:0] is involved 3: When comparing with alarm B, SUBSEC[14:3] is not involved, and only SUBSEC[2:0] is involved ... 0xC: When comparing with alarm B, SUBSEC[14:12] is not involved, and only SUBSEC[11:0] is involved 0xD: When comparing with alarm B, SUBSEC[14:13] is not involved, and only SUBSEC[12:0] is involved 0xE: When comparing with alarm B, SUBSEC[14] is not involved, and only SUBSEC[13:0] is involved 0xE: When comparing the alarm B, 15 SUBSEC bits all take part in, and the alarm can be activated only when all of them match. The synchronous counter overrun bit (Bit 15) is never compared. This bit is not 0 only after shift operation.
31:28	Reserved		

19.7.20 RTC backup register (RTC_BAKPx) (x=0-19)

Offset address: 0x50-0x9C

Reset value of backup domain: 0x0000 0000

Reset value: 0xXXXX XXXX

Field	Name	R/W	Description
31:0	BAKP	R/W	Backup Value Setup V _{BAT} will supply power after V _{DD} power supply is cut off, so this bit field is unaffected by system reset; when a tamper detection event occurs or the flash memory read protection is disabled, this register will be reset, and it will remain reset as long as TP1FLG=1. The contents of this bit field are valid even if the device is running in low-power mode.

20 Digital camera interface (DCI)

20.1 Full name and abbreviation description of terms

Table 78 Full name and abbreviation description of terms

Full name in English	English abbreviation
Digital Camera Interface	DCI
Joint Photo Experts Group	JPEG
Horizontal Synchronization	HSYNC
Vertical Synchronization	VSYNC

20.2 Introduction

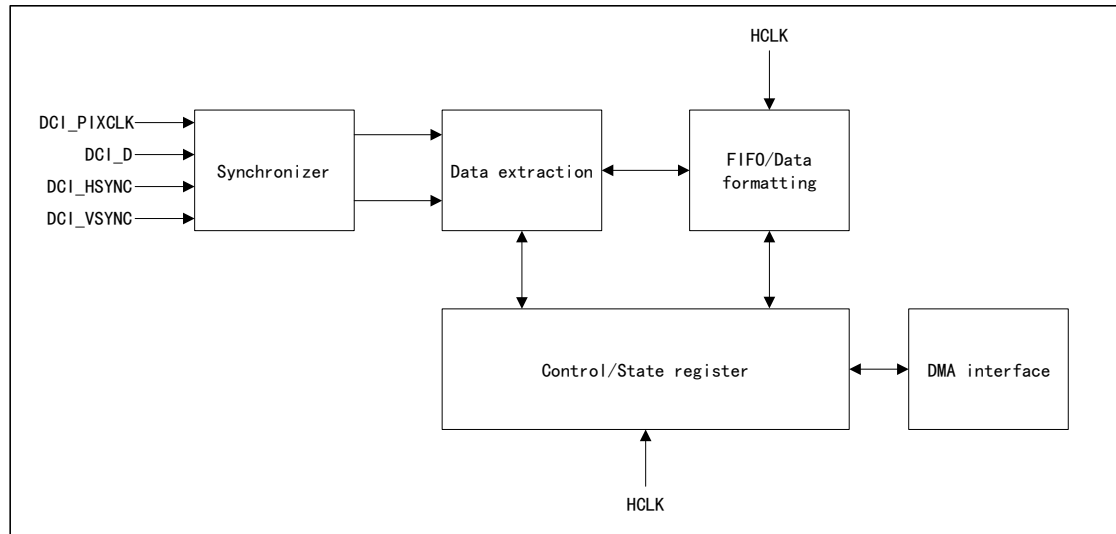

DCI is used to receive high-speed data streams from CMOS camera. It supports different data formats and is applicable to black-and-white cameras, X24 cameras and so on.

20.3 Main characteristics

- (1) Synchronous parallel interface
- (2) Can receive 8/10/12/14-bit data
- (3) Supported data format:
 - YCbCr4:2:2 line-by-line video
 - RGB565 line-by-line video
 - Compressed image (JPEG)
 - 8/10/12/14-bit line-by-line video
- (4) The edge polarity of the pixel clock can be selected to capture data
- (5) The data is transferred through DMA and the buffer is managed by DMA
- (6) There are two synchronization methods
 - Hardware synchronization: HSYNC signal and VSYNC signal
 - Software synchronization (only support 8-bit parallel data): Embedded code in data stream

20.4 Structure block diagram

Figure 66 DCI Structure Block Diagram

20.5 Functional description

20.5.1 Signal description

The physical interface input signal of DCI (in slave mode) consists of 8/10/12/14-bit data DCI_D, pixel clock PIXCLK, horizontal synchronization/data valid HSYNC and vertical synchronization VSYNC. The signal description is shown in the table below.

Table 79 DC signal Description

Name	Description
DCI_D	8/10/12/14-bit data captured by DCI,
PIXCLK	The data is synchronized with it and changes on the rising/falling edge of PIXCLK according to the polarity
HSYNC	Indicate start or end of line
VSYNC	Indicate start or end of frame

20.5.2 Pixel clock cycle

The data captured by DCI can be 8 bits, 10 bits, 12 bits and 14 bits. To generate a 32-bit data word, the number of pixel clock cycles needs to be different.

The 32-bit data word is divided into four 8-bit bytes, so DCI_D[7:0] can be stored as 8-bit data, and DCI_D[9:0], DCI_D[11:0] and DCI_D[13:0] can be stored as 10, 12 and 14 least significant bits of 16-bit words respectively, and the remaining most significant bits will be cleared to 0. Therefore, 32-bit data word can store four 8-bit data or two 10/12/14-bit data.

As shown in the following table, the captured data of four widths are different in the storage position of 32-bit data word, and the number of pixel clock cycles for generating 32-bit data words is also different.

Table 80 Position Arrangement of Four Widths and Number of PIXCLK Required

	8-bit data	10-bit data	12-bit data	14-bit data
LSB position of 32-bit data word	First byte	First byte	First byte	First byte
MSB position of 32-bit data word	Fourth byte	Second byte	Second byte	Second byte
Required pixel clock cycle	4	2	2	2

20.5.3 Synchronous mode

DCI supports hardware synchronization and embedded code synchronization. It should be noted that:

- (1) Only 8-bit parallel interface supports embedded code synchronization.
- (2) For compressed data (JPEG), DCI can only use hardware synchronization.

20.5.3.1 Hardware synchronization

Hardware synchronization means that the system receives data when HSYNC or VSYNC signals are at invalid level.

For compressed data, DCI uses VSYNC to indicate the start and end, and data are transmitted when HSYNC is at low level.

If you want to transmit images to DMA/RAM buffer, DCI will use VSYNC synchronization. By activating the vertical synchronization interrupt flag at the end of each frame, DMA can be enabled to manage continuous frames. If DMA transmits consecutive frames to multiple continuous buffers or buffers that can be cycled, the transmission can be conducted continuously.

20.5.3.2 Embedded code synchronization

Embedded code synchronization means that the system synchronizes the data with 32-bit value in the data stream that will no longer be used.

There are two modes. Different modes have different embedded codes.

Mode 1

In valid lines or during the inter-frame blanking interval:

- SAV: Start of line
- EAV: End of line

Mode 2

The synchronization code has 4 event types:

- Frame start (FS)
- Frame end (FE)
- Line start (LS)
- Line end (LE)

It consists of 4 bytes, all of which are in the format of 0xFF 00 00 XX (synchronization code). The value of synchronization code is programmed by DCI_ESYNCC register.

20.5.4 Capture mode

20.5.4.1 Snapshot mode

In snapshot mode, the module only captures single frame. After the system detects the "frame start", it will start to sample the data, and after the capture ends, the CEN bit of DCI_CTRL register will be cleared to 0; at this time, if frame overflow occurs, the frame will be lost.

20.5.4.2 Continuous acquisition mode

In continuous acquisition mode, the module can capture frames continuously and the frame capture frequency is configured by setting the FCRCFG bit of DCI_STS register. According to the selected synchronization mode, the system will collect data when the next VSYNC or frame start synchronization code is detected. When CEN bit of DCI_CTRL register is set to 1, the collection will occur continuously and when this bit is cleared to 0 and the current frame ends, the collection will stop.

20.5.5 Crop

DCI can use the cropping function to select a window of specified size in the image. The window size is determined by DCI_CROPWSTAT register and DCI_CROPWSIZE register.

The parameter definitions are shown in the following figure (the middle smaller rectangle is the selected window).

Figure 67 Parameter Definitions in Cropping Window

It should be noted that only when the value of CCNT is a multiple of 4, can data be transmitted through DMA.

20.5.6 JPEG format

Since JPEG is stored as data rather than frame or line, only when VSYNC is used as the start signal and HSYNC is used as the data enable signal, can the module receive JPEG images.

Only when the module captures a complete 32-bit word, can a DMA request be generated. Therefore, when the end of the frame is detected, the received data is less than 32 bits, and the remaining bits need to be stuffed with "0".

In addition, cropping function and embedded code synchronization mode cannot be used by JPEG format.

20.5.7 FIFO

The module is provided with a FIFO controller, which realizes FIFO with 4-word depth so as to manage the data transmission on AHB. If the transmission rate is greater than the maximum rate that AHB can bear, the FIFO data will be overwritten because there is no overflow protection.

When the synchronization signal is wrong or FIFO overflows, FIFO will be reset and DCI will wait for the new data frame.

20.5.8 Data format

The module supports three kinds of data formats:

- Monochrome format
- YCbCr format

- RGB565

The frame buffers of the above three kinds of data are stored in raster mode, with 32-bit words and they support little-endian alignment format.

Raster mode refers to start to scan from word 0 of pixel line 0 in the order of increasing address.

The width of these three data formats is different, so the storage methods in 32-bit words are also different, as shown in the table below.

Table 81 Storage Method of Different Data Formats

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Monochrome	n+1								n							
YCbCr	Y n								Cb n							
RGB565	Red n						Green n						Blue n			
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Monochrome	n+3								n+2							
YCbCr	Y n+1								Cr n							
RGB565	Red n+1						Green n+1						Blue n+1			

20.5.9 DCI interrupt

DCI has five interrupt sources:

- IT_LINE: End of line
- IT_FRAME: End of frame capture
- IT_OVR: Receive data overflow
- IT_VSYNC: Synchronization frame
- IT_ERR: An error is detected during embedded code synchronization frame detection

IT_DCI is a global interrupt. When any of the above interrupts occurs and is not masked, a global interrupt will be generated.

20.6 Register address mapping

Table 82 DCI Register Address Mapping

Register name	Description	Offset address
DCI_CTRL	DCI control regisster	0x00
DCI_STS	DCI state register	0x04
DCI_RINTSTS	DCI original interrupt state register	0x08
DCI_INTEN	DCI enable interrupt register	0x0C
DCI_MINTSTS	DCI mask interrupt state register	0x10

Register name	Description	Offset address
DCI_INTCLR	DCI clear interrupt register	0x14
DCI_ESYNCC	DCI embedded synchronization code register	0x18
DCI_ESYNCUM	DCI embedded synchronization unmask register	0x1C
DCI_CROPWSTAT	DCI cropping window start register	0x20
DCI_CROPWSIZE	DCI cropping window size register	0x24
DCI_DATA	DCI data register	0x28

20.7 Register functional description

20.7.1 DCI control register (DCI_CTRL)

Offset address: 0x00

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	CEN	R/W	Capture Enable 0: Disable 1: Enable
1	CMODE	R/W	Capture Mode 0: Continuous acquisition mode 1: Snapshot mode
2	CROPF	R/W	Crop Feature 0: When the number of bytes contained in the image frame is a multiple of 4, the module can obtain a complete image 1: When the window size is larger than the image size, the module captures the whole image; otherwise it only captures the image data of the specified area in the cropping window register (DCI_CROPWSTAT and DCI_CROPWSIZE)
3	JPGFM	R/W	JPEG Format 0: Uncompressed video format 1: JPEG format
4	ESYNCSSEL	R/W	Embedded Synchronization Select 0: Select hardware synchronization 1: Select embedded code synchronization
5	PXCLKPOL	R/W	Pixel Clock Polarity 0: Falling edge capture 1: Rising edge capture
6	HSYNCPOL	R/W	Horizontal Synchronization Polarity 0: Data is valid when HSYNC is at low level 1: Data is valid when HSYNC is at high level
7	VSYNCPOL	R/W	Vertical Synchronization Polarity 0: Data is valid when VSYNC is at low level 1: Data is valid when VSYNC is at high level

Field	Name	R/W	Description
9:8	FCRCFG	R/W	Frame Capture Rate Configure In continuous acquisition mode, this bit configures the frame capture frequency. 00: Capture all frames 01: Capture every other frame 10: Capture every three frames 11: Reserved
11:10	EXDMOD	R/W	Extended Data Mode Select the width of data to be captured by each PIXCLK. 00: 8 bits 01: 10 bits 10: 12 bits 11: 14 bits
13:12	Reserved		
14	DCIEN	R/W	DCI Enable 0: Disable 1: Enable
31:15	Reserved		

20.7.2 DCI state register (DCI_STS)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	HSYNCSTS	R	Status of HSYNC Pin When embedded code synchronization is selected, this bit indicates the status of HSYNC pin. 0: Effective frame 1: Inter-line synchronization
1	VSYNCSTS	R	Status of VSYNC Pin When embedded code synchronization is selected, this bit indicates the status of VSYNC pin. 0: Effective frame 1: Inter-frame synchronization
2	FIFONEMP	R	FIFO Not Empty 0: FIFO is empty 1: FIFO is not empty (including data)
31:3	Reserved		

20.7.3 DCI original interrupt state register (DCI_RINTSTS)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	CC_RINT	R	Capture Complete Raw Interrupt Status 0: No new data is captured 1: One new frame has been captured

Field	Name	R/W	Description
1	OVR_RINT	R	Overflow Raw Interrupt Status 0: No overflow 1: Data underflow
2	SYNCERR_RINT	R	Synchronization Error Raw Interrupt Status In the embedded code synchronization mode, if the module does not receive the embedded code in the correct order, a synchronization error interrupt will be generated. 0: No synchronization error 1: Synchronization error is detected
3	VSYNC_RINT	R	VSYNC Signal Raw Interrupt Status This interrupt is generated when VSYNC signal changes from invalid to valid.
4	LINE_RINT	R	Line Raw Interrupt Status This interrupt is generated when HSYNC signal changes from invalid to valid.
31:5	Reserved		

20.7.4 DCI enable interrupt register (DCI_INTEN)

Offset address: 0x0C

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	CCINTEN	R/W	Capture Complete Interrupt Enable 0: Disable 1: Enable
1	OVRINTEN	R/W	Overflow Interrupt Enable 0: Disable 1: Enable
2	SYNCERRINTEN	R/W	Synchronization Error Interrupt Enable 0: Disable 1: Enable
3	VSYNCINTEN	R/W	VSYNC Signal Interrupt Enable 0: Disable 1: Enable
4	LINEINTEN	R/W	Line Interrupt Enable 0: Disable 1: Enable
31:5	Reserved		

20.7.5 DCI mask interrupt state register (DCI_MINTSTS)

Offset address: 0x10

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	CC_MINT	R	Capture Complete Masked Interrupt Status 0: Mask 1: Not mask

Field	Name	R/W	Description
1	OVR_MINT	R	Overrun Masked Interrupt Status 0: Mask 1: Not mask
2	SYNCERR_MINT	R	Synchronization Error Masked Interrupt Status 0: Mask 1: Not mask
3	VSYNC_MINT	R	VSYNC Signal Masked Interrupt Status 0: Mask 1: Not mask
4	LINE_MINT	R	Line Masked Interrupt Status 0: Mask 1: Not mask
31:5	Reserved		

20.7.6 DCI clear interrupt register (DCI_INTCLR)

Offset address: 0x14

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	CC_INTCLR	W	Capture Complete Interrupt Status Clear Write 1 to this bit to clear DCI_RINTSTS[0].
1	OVR_INTCLR	W	Overrun Interrupt Status Clear Write 1 to this bit to clear DCI_RINTSTS[1].
2	SYNCERR_INTCLR	W	Synchronization Error Interrupt Status Clear Write 1 to this bit to clear DCI_RINTSTS[2].
3	VSYNC_INTCLR	W	VSYNC Signal Interrupt Status Clear Write 1 to this bit to clear DCI_RINTSTS[3].
4	LINE_INTCLR	W	Line Interrupt Status Clear Write 1 to this bit to clear DCI_RINTSTS[4].
31:5	Reserved		

20.7.7 DCI embedded synchronization code register (DCI_ESYNCC)

Offset address: 0x18

Reset value: 0x0000 0000

The separation code consists of 4 bytes, all of which are in the format of 0xFF 00 00 XX (separation code). For the definition of separation code, see the text.

This register is used to program the value of separation code.

Field	Name	R/W	Description
7:0	FSDC	R/W	Frame Start Delimiter Code
15:8	LSDC	R/W	Line Start Delimiter Code
23:16	LEDC	R/W	Line End Delimiter Code
31:24	FEDC	R/W	Frame End Delimiter Code

20.7.8 DCI embedded synchronization unmask register (DCI_ESYNCUM)

Offset address: 0x1C

Reset value: 0x0000 0000

This register is used to determine whether to mask the embedded code separator. When masked, the received data will not be compared with the separator. When the separator is unmasked, the module will compare the value in DCI_ESYNCC with the value of the corresponding bit of the data.

Field	Name	R/W	Description
7:0	FSDUM	R/W	Frame Start Delimiter Unmask 0: Mask 1: Unmask
15:8	LSDUM	R/W	Line Start Delimiter Unmask 0: Mask 1: Unmask
23:16	LEDUM	R/W	Line End Delimiter Unmask 0: Mask 1: Unmask
31:24	FEDUM	R/W	Frame End Delimiter Unmask 0: Mask 1: Unmask

20.7.9 DCI cropping window start register (DCI_CROPWSTAT)

Offset address: 0x20

Reset value: 0x0000 0000

Field	Name	R/W	Description
13:0	HOFSCNT	R/W	Horizontal Offset Count This value is the number of PIXCLK that should be vacated in the window line before capturing data.
15:14	Reserved		
28:16	VSLINECNT	R/W	Vertical Start Line Count This bit decides to start capturing data from which line. 0x0000: Line 1 0x0001: Line 2

21.2 Introduction

USART (universal synchronous/asynchronous transceiver) is a serial communication device that can flexibly exchange full-duplex and half-duplex data with external devices, and meets the requirements of external devices for industry standard NRZ asynchronous serial data format. USART also provides a wide range of baud rate for selection and supports multiprocessor communication.

USART not only supports standard asynchronous transceiver mode, but also supports some other serial data exchange modes, such as LIN protocol, smart card protocol, IrDA SIR ENDEC specification and hardware flow control mode.

USART also supports DMA function to realize high-speed data communication.

21.3 Main characteristics

- (1) Full duplex asynchronous communication
- (2) Single-line half-duplex communication
- (3) NRZ standard format
- (4) Characteristics of programmable serial port:
 - Data bit: 8 or 9 bits
 - Check bits: Even parity check, odd parity check, no check
 - Support 0.5, 1, 1.5 and 2 stop bits
- (5) Check control

- Transmit the check bit
 - Check the received data
- (6) Select speed and clock tolerance with programmable 8 or 16-time oversampling rate
- (7) Independent transmitter and receiver enable bit
- (8) Programmable baud rate generator
- (9) Multiprocessor communication:
- If the address does not match, it will enter the mute mode
 - Wake up from mute mode through idle bus detection or address flag detection
- (10) Synchronous transmission mode
- (11) Generation and detection of LIN break frame
- (12) Support the smart card interface of ISO7816-3 standard
- (13) Support IrDA protocol
- (14) Support hardware flow control
- (15) DMA can be used for continuous communication
- (16) State flag bit:
- Transmission detection flag: The transmit register is empty, the receive register is not empty, and transmission is completed
 - Error detection flag: Overrun error, noise error, parity error, frame error
- (17) Multiple interrupt sources:
- The transmit register is empty
 - Transmission is completed
 - CTS changed
 - The receive register cannot be empty
 - Overload error
 - Bus idle
 - Parity error
 - LIN disconnection detection
 - Noise error
 - Overrun error
 - Frame error

21.4 Functional description

Table 84 USAR Pin Description

Pin	Type	Description
USART_RX	Input	Data receiving
USART_TX	Output I/O (single-line mode/smart card mode)	Data transmission It is high level by default when the transmitter is enabled and does not transmit data
USART_CK	Output	Clock output
USART_nRTS	Input	Request to send in hardware flow control mode
USART_nCTS	Output	Clear to send in hardware flow control mode
IrDA_RDI	Input	Data input in IrDA mode
IrDA_TDO	Output	Data output in IrDA mode

21.4.1 Single-line half-duplex communication

HDEN bit of USART_CTRL3 register determines whether to enter the single-line half-duplex mode.

When USART enters single-line half-duplex mode:

- The CLKEN and LINMEN bit of USART_CTRL2 register, and IREN and SCEN bits of USART_CTRL3 register must be cleared.
- RX pin is disabled.
- TX pin should be configured as open-drain output and connected with RX pin inside the chip.
- Transmitting data and receiving data can not be carried out at the same time. The data cannot be received before they are sent. If needing to receive data, enabling receiving can be turned on only after TXCFLG bit of USART_STS register is set to 1.
- If there is data collision on the bus, software management is needed to allocate the communication process.

21.4.2 Frame format

The frame format of data frame is controlled by USART_CTRL1 register

- DBLCFG bit controls the character length, which can be set to 8 or 9 bits.
- PCEN bit controls to enable the check bit or not.
- PCFG bit controls the parity bit to be odd or even.

Table 85 Frame Format

DBLCFG bit	PCEN bit	USART data frame
0	0	Start bit+8-bit data+stop bit
0	1	Start bit+7-bit data+odd-even parity check bit+stop bit
1	0	Start bit+9-bit data+stop bit
1	1	Start bit+8-bit data+odd-even parity check bit+stop bit

Configurable stop bit

Four different stop bits can be configured through STOPCFG bit of USART_CTRL2 register.

- 1 stop bits: Default stop bit.
- 0.5 stop bits: Used when receiving data in smart card mode.
- 2 stop bits: Used in normal mode, single-line mode and hardware flow control mode.
- 1.5 stop bits: Used when transmitting and receiving data in smart card mode.

Check bit

PCFG bit of USART_CTRL1 determines the parity check bit; when PCFG=0, it is even parity check, on the contrary, it is odd parity check.

- Even check: When the number of frame data and check bit 1 is even, the even check bit is 0; otherwise it is 1.
- Odd check: When the number of frame data and check bit 1 is even, the odd check bit is 1; otherwise it is 0.

21.4.3 Transmitter

When TXEN bit of the register USART_CTRL1 is set, the transmit shift register will output data through TX pin and the corresponding clock pulses will be output through CK pin.

21.4.3.1 Character transmitting

During transmitting period of USART, the least significant bit of the data will be moved out by TX pin first. In this mode, USART_DATA register has a buffer between the internal bus and the transmitter shift register.

A data frame is composed of the start bit, character and stop bit, so there is a low-level start bit in front of each character; then there is a high-level stop bits the number of which is configurable.

Transmission configuration steps

- Set UEN bit of USART_CTRL1 register to enable USART.

- Decide the word length by setting DBLCFG bit of USART_CTRL1 register.
- Decide the number of stop bits by setting STOPCFG bit of USART_CTRL2 register.
- If multi-buffer communication is selected, DMA should be enabled in USART_CTRL3 register.
- Set the baud rate of communication in USART_BR register.
- Enable TXEN bit in USART_CTRL1 register, and transmit an idle frame.
- Wait for TXBEFLG bit of USART_STS register to be set to 1.
- Write data to USART_DATA register (if DMA is not enabled, repeat steps 7-8 for each byte to be sent).
- Wait for TXCFLG bit of USART_STS register to be set to 1, indicating transmission completion.

Note: TXEN bit cannot be reset during data transmission; otherwise, the data on TX pin will be destroyed, which is because if the baud rate generator stops counting, the data being transmitted will be lost.

21.4.3.2 Single-byte communication

TXBEFLG bit can be cleared by writing USART_DATA register. When the TXBEFLG bit is set by hardware, the shift register will receive the data transferred from the data transmit register, then the data will be transmitted, and the data transmit register will be cleared. The next data can be written in the data register without covering the previous data.

- (1) If TXBEIEN in USART_CTRL1 register is set to 1, an interrupt will be generated.
- (2) If USART is in the state of transmitting data, write to the data register to save the data to the DATA register, and transfer the data to the shift register at the end of the current data transmission.
- (3) If USART is in idle state, write to the data register, put the data into the shift register, start transmitting data, and set TXBEFLG bit to 1.
- (4) When a data transmission is completed and TXBEFLG bit is set, TXCFLG bit will be set to 1; at this time if TXCIEN bit in USART_CTRL1 register is set to 1, an interrupt will be generated.
- (5) After the last data is written in the USART_DATA register, before entering the low-power mode or before closing the USART module, wait to set TXCFLG to 1.

21.4.3.3 Break frame

The break frames are considered to receive 0 in a frame period. Setting TXBF bit of USART_CTRL1 register can transmit a break frame, and the length of the break frame is determined by DBLCFG bit of USART_CTRL1 register. If the

TXBF bit is set, after completion of transmission of current data, the TX line will transmit a break frame, and after completion of transmission of break frame, the TXBF bit will be reset. At the end of the break frame, the transmitter inserts one or two stop bits to respond to the start bit.

Note: If the TXBF bit is reset before transmission of the break frame starts, the break frame will not be transmitted. To transmit two consecutive break frames, the TXBF bit should be set after the stop bit of the previous disconnection symbol.

21.4.3.4 Idle frame

The idle frame is regarded as a complete data frame composed entirely of 1, followed by the start bit of the next frame containing the data. Set TXEN bit of USART_CTRL1 register to 1 and one idle frame can be set before the first data frame.

21.4.4 Receiver

21.4.4.1 Character receiving

During receiving period of USART, RX pin will first introduce the least significant bit of the data. In this mode, USART_DATA register has a buffer between the internal bus and the receive shift register. The data is transmitted to the buffer bit by bit. When fully receiving the data, the corresponding receive register is not empty, then the user can read USART_DATA.

Receiving configuration steps

- Set UEN bit of USART_CTRL1 register to enable USART.
- Decide the word length by setting DBLCFG bit of USART_CTRL1 register.
- Decide the number of stop bits by setting STOPCFG bit of USART_CTRL2 register.
- If multi-buffer communication is selected, DMA should be enabled in USART_CTRL3 register.
- Set the baud rate of communication in USART_BR register.
- Set RXEN bit of USART_CTRL1 to enable receiving.

Note:

- (1) RXEN bit cannot be reset during data receiving period; otherwise, the bytes being received will be lost.
- (2) In the process when the receiver is receiving a data frame, if overrun error, noise error or frame error is detected, the error flag will be set to 1.
- (3) When data is transferred from the shift register to USART_DATA register, the RXBNEFLG bit of USART_STS will be set by hardware.
- (4) An interrupt will be generated if RXBNEIEN bit is set.

- (5) In single buffer mode, the RXBNEFLG bit can be cleared by reading USART_DATA register by software or by writing 0.
- (6) In multi-buffer mode, after each byte is received, RXBNEFLG bit of USART_STS register will be set to 1, and DMA will read the data register to clear it.

21.4.4.2 Break frame

When the receiver receives a break frame, USART will handle it as receiving a frame error.

21.4.4.3 Idle frame

When the receiver receives an idle frame, USART will handle it as receiving an ordinary data frame; if IDLEIEN bit of USART_CTRL1 is set, an interrupt will be generated.

21.4.4.4 Oversampling rate

OSMCFG bit of USART_CTRL1 register determines the oversampling rate.

If the oversampling rate is 8 times of the baud rate, the speed is higher, but the clock tolerance is smaller. If it is 16 times, the speed is lower, but the clock tolerance is bigger.

21.4.4.5 Overrun error

When RXBNEFLG bit of USART_STS register is set to 1 and a new character is received at the same time, an overrun error will be caused. Only after RXEN is reset, can the data be transferred from the shift register to DATA register. RXBNEFLG bit will be set to 1 after receiving the byte. This bit needs to be reset before receiving the next data or serving the previous DMA request; otherwise, an overrun error will be caused.

When an overrun error occurs

- USART_STS OVREFLG bit set to 1.
- The data in DATA register will not be lost.
- The data in the shift register received before will be overwritten, but the data received later will not be saved.
- If RXBNEIEN bit of USART_CTRL1 is set to 1, an interrupt will be generated.
- When OVREFLG bit is set to 1, it means that the data has been lost. There are two possibilities:
 - When RXBNEFLG=1, the previous valid data is still on DATA register, and can be read.
 - When RXBNEFLG=0, there is no valid data in DATA register.
- The OVREFLG bit can be reset through read operation for USART_STS and USART_DATA registers.

21.4.4.6 Noise error

When noise is detected in receiving process of the receiver:

- Set NE flag on the rising edge of RXBNEFLG bit of USART_STS register.
- Invalid data is transmitted from the shift register to USART_DATA register.

Note: 8-time oversampling ratio cannot be used in LIN, smart card and IrDA modes.

21.4.4.7 Frame error

If the stop bit is not received and recognized at the expected receiving time due to excessive noise or lack of synchronization, a frame error will be detected.

When a frame error is detected in receiving process of the receiver:

- (1) Set the FEFLG bit of USART_STS register.
- (2) Invalid data is transmitted from the shift register to USART_DATA register.
- (3) In single byte communication, there is no interrupt, but in multi-buffer communication, an interrupt will be generated by setting the ERRIEN bit of USART_CTRL3 register.

21.4.5 Baud rate generator

The baud rate division factor (USARTDIV) is a 16-digit number consisting of 12-digit integer part and 4-digit decimal part. Its relationship with the system clock:

$$\text{Baud rate} = \text{PCLK} / 16 \times (\text{USARTDIV})$$

The system clock of USART2/3 is PCLK1, and that of USART1 is PCLK2. USART can be enabled only after the clock control unit enables the system clock.

21.4.6 Multi-processor communication

In multi-processor communication, multiple USARTs are connected to form a network. In this network, two devices communicate with each other, and the mute mode can be enabled for other devices not participating in the communication in order to reduce the burden of USART. In mute mode, no receive state bit will be set and all receive interrupts are disabled.

When mute mode is enabled, there are two ways to exit the mute mode:

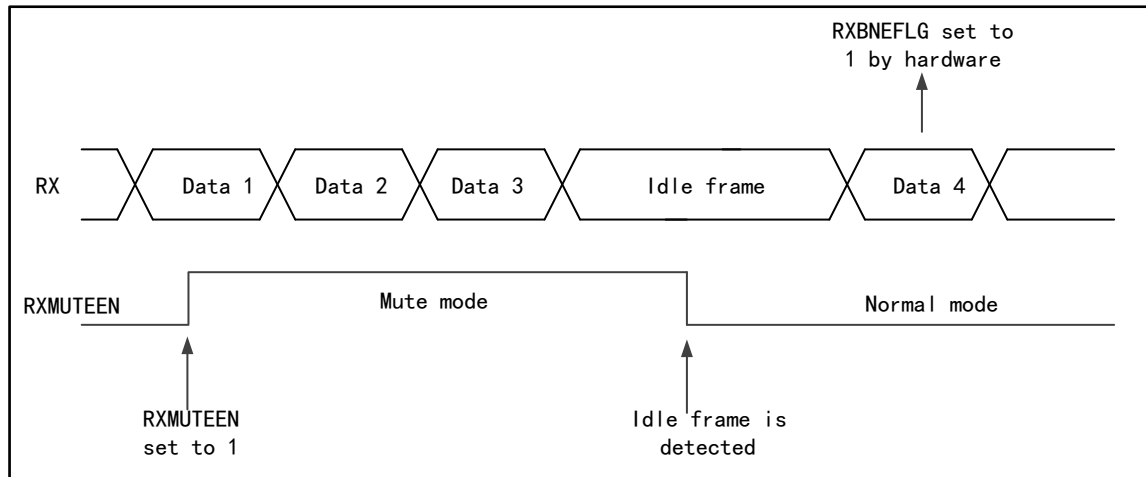

- WUPMCFG bit is cleared and the bus is idle to exit the mute mode.
- WUPMCFG bit is set and after receiving the address flag, it can exit the mute mode.

Idle bus detection (WUPMCFG=0)

When RXMUTEEN is set to 1, USART enters the mute mode, and it can be

waken up from the mute mode when an idle frame is detected, meanwhile, the RXMUTEEN bit will be cleared by the hardware. RXMUTEEN can also be cleared by software.

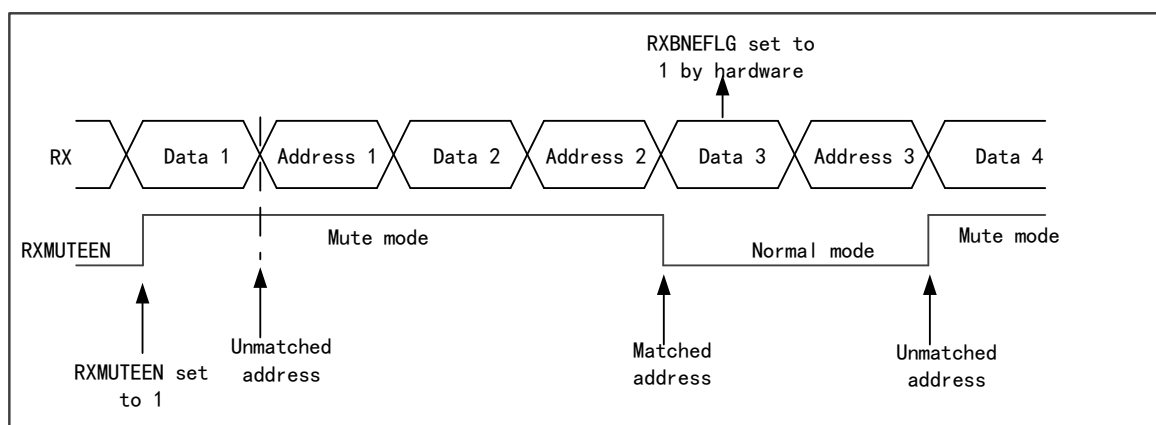

Figure 68 Idle Bus Exit Mute Mode

Address flag detection (WUPMCFG=1)

If the address flag bit is 1, this byte is regarded as the address. The storage address of lower four bits of the address bytes will first be compared with its own address when the receiver receives the address byte. If the addresses do not match, the receiver will enter the mute mode. If the addresses match, the receiver will wake up from the mute mode and be ready to receive the next byte. If the address byte is received again after exiting the mute mode, but the address does not match its own address, the receiver will enter the mute mode again.

Figure 69 Address Flag Exit Mute Mode

21.4.7 Synchronous mode

The synchronous mode supports full duplex synchronous serial communication in master mode, and has one more signal line USART_CK which can output synchronous clock than the asynchronous mode.

CLKEN bit of USART_CTRL2 register decides whether to enter the synchronous mode.

When USART enters the synchronous mode:

- The LINMEN bit of USART_CTRL2 register, and IREN, HDEN and SCEN bits of USART_CTRL3 register must be cleared.
- The start bit and stop bit of data frame have no clock output.
- Whether the last data bit of data frame generates USART_CK clock is decided by the LBCPOEN bit of USART_CTRL2 register.
- The clock polarity of USART_CK is decided by CPOL bit of USART_CTRL2 register.
- The phase of USART_CK is decided by the CPHA bit of USART_CTRL2.
- The external CK clock cannot be activated when the bus is idle or the frame is disconnected.

Figure 70 USART Synchronous Transmission Example

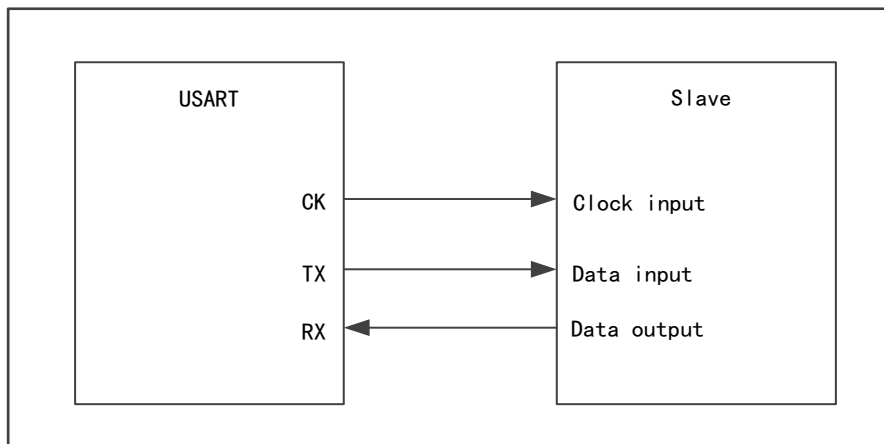

Figure 71 USART Synchronous Transmission Timing Diagram (DBLCFG=0)

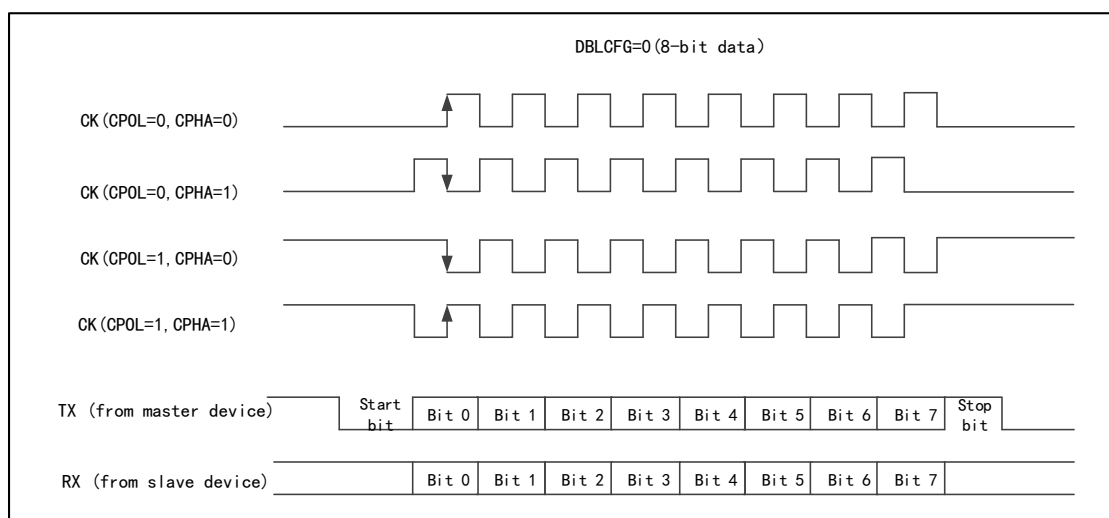

Figure 72 USART Synchronous Transmission Timing Diagram (DBLCFG=1)

21.4.8 LIN mode

LINMEN bit of USART_CTRL2 register decides whether to enter LIN mode.

When entering LIN mode:

- All data frames are 8 data bits and 1 stop bit.
- The CLKEN bit and STOPCF bit of USART_CTRL2 register and IREN bit, HDEN bit and SCEN bit of USART_CTRL3 register need to be cleared.

In LIN master mode, USART can generate break frame, and the detection length of break frame can be set to 10 bits and 11 bits through LBDLCFG bit of USART_CTRL2. The break frame detection circuit is independent of USART receiver, and no matter in idle state or in data transmission state, RX pin can detect the break frame, and LBDLFLG bit of USART_STS register is set to 1; at this time, if LBDIEN bit of USART_CTRL2 is enabled, an interrupt will be generated.

Detection of break frame in idle state

In idle state, if a break frame is detected on RX pin, the receiver will receive a data frame of 0 and generate FEFLG.

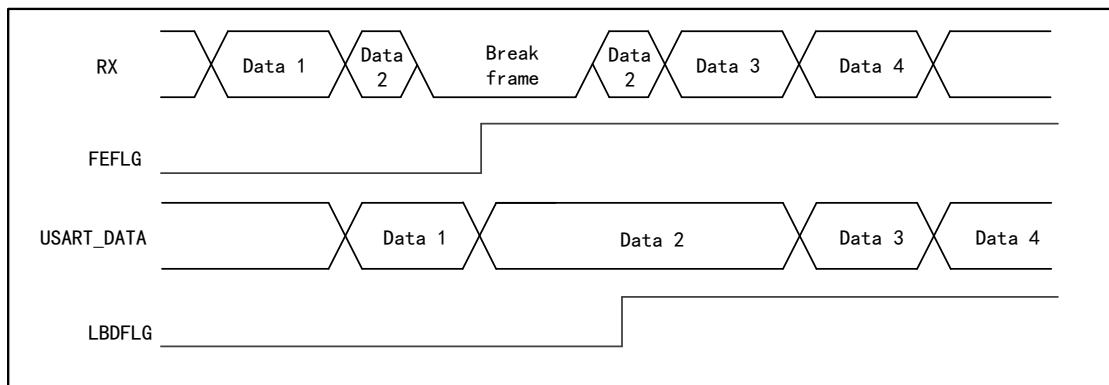

Figure 73 Break Frame Detection in Idle State

Break frame detection in data transmission state

In the process of data transmission, if the RX pin detects the break frame, the currently transmitted data frame will generate FEFLG.

Figure 74 Break Frame Detection in Data Transmission State

21.4.9 Smart card mode

Smart card mode is a single-line half-duplex communication mode. The interface supports ISO7816-3 standard protocol and can control the reading and writing of smart cards that meet the standard protocol.

SCEN bit of USART_CTRL3 register decides whether to enter the smart card mode.

When USART enters the smart card mode:

- The LINMEN bit of USART_CTRL2 register, and IREN and HDEN bits of USART_CTRL3 register must be cleared.
- The data frame format is 8 data bits and 1 check bit, and 0.5 or 1.5 stop bits are used. (To avoid switching between two configurations, it is recommended to use 1.5 stop bits when transmitting and receiving data)
- CLKEN bit of USART_CTRL2 can be set to provide clocks for smart card.

- During the communication, when the receiver detects a parity error, in order to inform the transmitter that the data has not been received successfully, the data line will be pulled down after half a baud rate clock, and keep pulling down for one baud rate clock.
- The break frame has no meaning in smart card mode. A 00h data with frame error will be regarded as a data instead of disconnection symbol.

Figure 75 ISO7816-3 Standard Protocol

21.4.10 Infrared (IrDA SIR) function mode

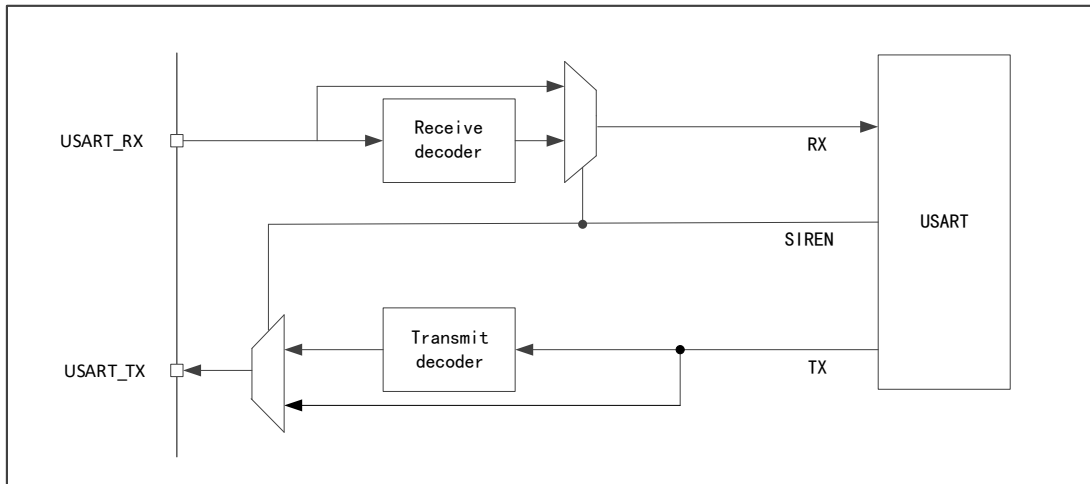

IrDA mode is a half-duplex protocol, transmitting and receiving data can not be carried out at the same time, and the delay between data transmitting and receiving should be more than 10ms.

IREN bit of USART_CTRL3 register decides whether to enter the IrDA mode.

When USART enters the IrDA mode:

- The CLKEN bit, STOPCF bit and LINMEN bit of USART_CTRL2 register and HDEN bit and SCEN bit of USART_CTRL3 register must be cleared.
- The data frame uses 1 stop bit and the baud rate is less than 115200Hz.
- Using infrared pulse (RZI) indicates logic 0, so in normal mode, its pulse width is 3/16 baud rate cycles. When IrDA is in low mode, it is recommended that the pulse width be greater than three DIV frequency division clocks so as to ensure that this pulse can be detected by IrDA normally.

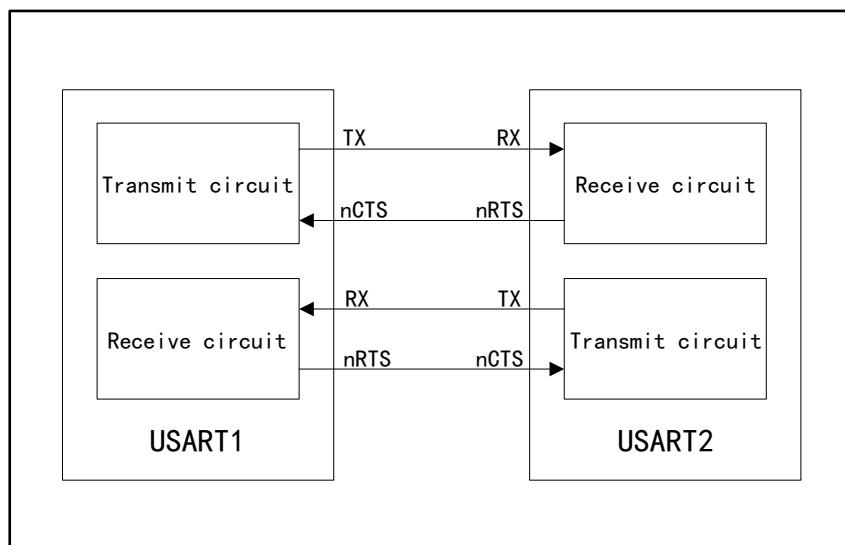

Figure 76 IrDA Mode Block Diagram

21.4.11 Hardware flow control

The function of hardware flow control is to control the serial data stream between two devices through nCTS pin and nRTS pin.

Figure 77 Hardware Flow Control between Two USART

CTS flow control

CTSEN bit of USART_CTRL3 register determines whether CTS flow control is enabled. If CTS flow control is enabled, the transmitter will detect whether the data frame of nCTS pin can be sent. If TXBEFLG bit=0 for USART_STS register and nCTS is pulled to low level, the data frame can be sent. If nCTS becomes high during transmission, the transmitter will stop transmitting after the current data frame is transmitted.

RTS flow control

RTSEN bit of USART_CTRL3 register determines whether RTS flow control is

enabled. If RTS flow control is enabled, when the receiver receives data, nRTS will be pulled to low level. When a data frame is received, nRTS will become high to inform the transmitter to stop transmitting data frame.

21.4.12 DMA multi-processor communication

USART can access the data buffer in DMA mode in order to reduce the burden of processors.

Transmission in DMA mode

DMATXEN bit of USART_CTRL3 register determines whether to transmit in DMA mode. When transmitting by DMA, the data in the designated SRAM will be transmitted to the buffer by DMA.

Configuration steps of transmission by DMA:

- Clear the TXCFLG bit of USART_STS register.
- Set the address of SRAM memory storing data as DMA source address.
- Set the address of USART_DATA register as DMA destination address.
- Set the number of data bytes to be transmitted.
- Set channel priority.
- Set interrupt enable.
- Enable DMA channel.
- Wait for TXCFLG bit of USART_STS register to be set to 1, indicating transmission completion.

Receive in DMA mode

DMARXEN bit of USART_CTRL3 register determines whether to use DMA mode to receive; when DMA is used to receive, every time one byte is received, the received buffer data will be transmitted to the specified SRAM area by DMA.

Configuration steps of receiving by DMA:

- Set the address of USART_DATA register as DMA source address.
- Set the address of SRAM memory storing data as DMA destination address.
- Set the number of data bytes to be transmitted.
- Set channel priority.
- Set interrupt enable.
- DMA channel enable.

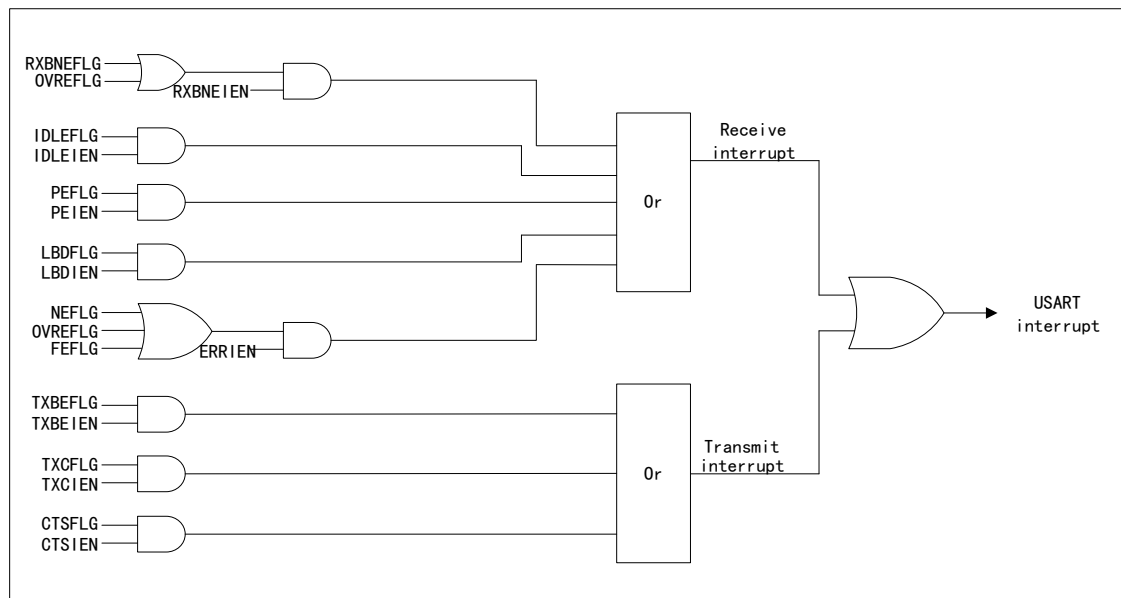

21.4.13 Interrupt request

Table 86 USART Interrupt Request

Interrupt event	Event flag bit	Enable bit
The receive register cannot be empty	RXBNEFLG	RXBNEIEN
Overload error	OVREFLG	
Line idle is detected	IDLEFLG	IDLEIEN
Odd-even parity error	PEFLG	PEIEN
LIN break frame flag	LBDFLG	LBDIEN
Receiving error in DMA mode	Noise error	NEFLG
	Overrun error	OVREFLG
	Frame error	FEFLG
Data transmit register is empty	TXBEFLG	TXBEIEN
Transmission is completed	TXCFLG	TXCIEN
CTS flag	CTSFLG	CTSIEN

All interrupt requests of USART are connected to the same interrupt controller, and the interrupt requests have logical or relational before they are sent to the interrupt controller.

21.6.4 Control register 1 (USART_CTRL1)

Offset address: 0x0C

Reset value: 0x0000

Field	Name	R/W	Description
0	TXBF	R/W	<p>Transmit Break Frame</p> <p>0: Not transmit 1: Will transmit</p> <p>This bit can be set by software and cleared by hardware when the stop bit of the break frame is sent.</p>
1	RXMUTEEN	R/W	<p>Receive Mute Mode Enable</p> <p>0: Normal working mode 1: Mute mode</p> <p>This bit is set or cleared by software, or cleared by hardware when wake-up sequence is detected.</p> <p>USART must receive a data before it is put in the mute mode, so that it can be detected and awakened by idle bus.</p> <p>In the wake-up of address flag detection, if the RXBNEFLG bit is set, the RXMUTEEN bit cannot be modified by software.</p>
2	RXEN	R/W	<p>Receive Enable</p> <p>0: Disable 1: Enable, and start to detect the start bit on RX pin</p>
3	TXEN	R/W	<p>Transmit Enable</p> <p>0: Disable 1: Enable</p> <p>Except in smart card mode, if there is a 0 pulse on this bit at any time of transmitting data, an idle bus will be transmitted after the current data is transmitted.</p> <p>After this bit is set, the data will be transmitted after one-bit time.</p>
4	IDLEIEN	R/W	<p>IDLE Interrupt Enable</p> <p>0: Disable 1: Generate an interrupt when IDLEFLG is set</p>
5	RXBNEIEN	R/W	<p>Receive Buffer Not Empty Interrupt Enable</p> <p>0: Disable 1: Generate an interrupt when OVREFLG or RXBNEFLG is set</p>
6	TXCIEN	R/W	<p>Transmit Complete Interrupt Enable</p> <p>0: Disable 1: Generate an interrupt when TXCFLG is set</p>
7	TXBEIEN	R/W	<p>Transmit Buffer Empty Interrupt Enable</p> <p>0: Interrupt generation is disabled 1: Generate an interrupt when TXBEFLG is set</p>
8	PEIEN	R/W	<p>Parity Error interrupt Enable</p> <p>0: Interrupt generation is disabled 1: Generate an interrupt when PEFLG is set</p>
9	PCFG	R/W	<p>Odd/Even Parity Configure</p> <p>0: Even parity check 1: Odd parity check</p> <p>The selection will not take effect until the current transmission of bytes is completed.</p>

Field	Name	R/W	Description
10	PCEN	R/W	Parity Control Enable 0: Disable 1: Enable If this bit is set, a check bit will be inserted in the most significant bit when transmitting data; when receiving data, check whether the check bit of the received data is correct. The check control will not take effect until the current transmission of bytes is completed.
11	WUPMCFG	R/W	Wakeup Method Configure 0: Idle bus wakeup 1: Address tag wakeup
12	DBLCFG	R/W	Data Bits Length Configure 0: 1 start bit, 8 data bits, n stop bits 1: 1 start bit, 9 data bits, n stop bits This bit cannot be modified during transmission of data.
13	UEN	R/W	USART Enable 0: USART frequency divider and output are disabled 1: USART module is enabled
14	Reserved		
15	OSMCFG	R/W	Oversampling Mode Configure 0: 16-time oversampling 1: 8-time oversampling This bit can be set only when USART is not enabled.
31:16	Reserved		

21.6.5 Control register 2 (USART_CTRL2)

Offset address: 0x10

Reset value: 0x0000 0000

Field	Name	R/W	Description
3:0	ADDR[3:0]	R/W	USART Device Node Address Setup This bit is valid only in the mute mode of multiprocessor communication, and decides to enter the mute mode or wake up according to whether the detected address tags are consistent.
4	Reserved		
5	LBDLCFG	R/W	LIN Break Detection Length Configure 0: 10 bits 1: 11 bits
6	LBDIEN	R/W	LIN Break Detection Interrupt Enable 0: Disable 1: Generate an interrupt when LBDFLG bit is set
7	Reserved		
8	LBCPOEN	R/W	Last Bit Clock Pulse Output Enable 0: Not output from CK 1: Output from CK

Field	Name	R/W	Description
			This bit is valid only in synchronous mode; this bit does not exist on UART4 and UART5.
9	CPHA	R/W	Clock Phase Configure This bit indicates on the edge of which clock sampling is conducted 0: The first 1: The second This bit is valid only in synchronous mode; this bit does not exist on UART4 and UART5.
10	CPOL	R/W	Clock Polarity Configure The state of CK pin when USART is in idle state 0: Low level 1: High level This bit is valid only in synchronous mode; this bit does not exist on UART4 and UART5.
11	CLKEN	R/W	Clock Enable (CK pin) 0: Disable 1: Enable This bit does not exist on UART4 and UART5.
13:12	STOPCFG	R/W	STOP Bit Configure 00: 1 stop bit 01: 0.5 stop bit 10: 2 stop bits 11: 1.5 stop bits This bit does not exist on UART4 and UART5.
14	LINMEN	R/W	LIN Mode Enable 0: Disable 1: Enable
31:15	Reserved		

Note: These three bits (CPOL, CPHA and LBCPOEN) cannot be changed after transmission is enabled.

21.6.6 Control register 3 (USART_CTRL3)

Offset address: 0x14

Reset value: 0x0000

Field	Name	R/W	Description
0	ERRIEN	R/W	Error interrupt Enable 0: Disable 1: Enable; when DMARXEN is set and one among FEFLG, OVREFLG or NEFLG is set, an interrupt will be generated.
1	IREN	R/W	IrDA Function Enable 0: Disable 1: Enable
2	IRLPEN	R/W	IrDA Low-power Mode Enable 0: Normal mode 1: Low-power mode

Field	Name	R/W	Description
3	HDEN	R/W	Half-duplex Mode Enable 0: Disable 1: Enable
4	SCNACKEN	R/W	NACK Transmit Enable During Parity Error in Smartcard Function 0: NACK is not sent 1: Transmit NACK This bit does not exist on UART4 and UART5.
5	SCEN	R/W	Smartcard Function Enable 0: Disable 1: Enable This bit does not exist on UART4 and UART5.
6	DMARXEN	R/W	DMA Receive Enable 0: Disable 1: Enable This bit does not exist on UART4 and UART5.
7	DMATXEN	R/W	DMA Transmit Enable 0: Disable 1: Enable This bit does not exist on UART4 and UART5.
8	RTSEN	R/W	RTS Hardware Flow Control Function Enable 0: Disable 1: Enable RTS interrupt RTS: Require To Send, which is output signal, indicating it has been ready to receive. Request is made to receive data only when there is space in the receive buffer; when data can be received, RTS output is pulled to low level. This bit does not exist on UART4 and UART5.
9	CTSEN	R/W	CTS Hardware Flow Control Function Enable 0: Disable 1: Enable CTS: Clear To Send, which is input signal When CTS input signal is at low level, the data can be transmitted; otherwise, the data cannot be transmitted; if CTS signal is pulled to high during data transmission, the data transmission will be stopped after this data is transmitted; if write operation is performed for the data register when CTS is high, the data will not be transmitted until CTS is valid. This bit does not exist on UART4 and UART5.
10	CTSIEN	R/W	CTS Interrupt Enable 0: Disable 1: Generate an interrupt when CTSFLG is set This bit does not exist on UART4 and UART5.
11	SAMCFG	R/W	Sample Method Configure 0: Sampling for three times 1: Single sample; flag of noise detection disabled This bit can be set only when USART is not enabled.

Field	Name	R/W	Description
31:12			Reserved

21.6.7 Protection time and prescaler register (USART_GTPSC)

Offset address: 0x18

Reset value: 0x0000

Field	Name	R/W	Description
7:0	PSC	R/W	<p>Prescaler Factor Setup</p> <p>Divide the frequency and provide clock for the system clock respectively; in different working modes, the valid bits of PSC have difference, specifically as follows:</p> <p>In infrared low-power mode: PSC[7:0] is valid. 00000000: Reserved 00000001: 1 divided frequency 00000010: 2 divided frequency 11111111: 255 divided frequency</p> <p>In infrared normal mode: PSC can only be set to 00000001</p> <p>In smart card mode: PSC[7:5] invalid, PSC[4:0] valid 00000: Reserved 00001: 2 divided frequency 00010: 4 divided frequency 00011: 6 divided frequency 11111: 62 divided frequency</p> <p>This bit does not exist on UART4 and UART5.</p>
15:8	GRDT	R/W	<p>Guard Time Value Setup</p> <p>After transmitting data, TXCFLG can be set after the protection time; the time unit is baud clock; it can be applied to smart card mode; this bit does not exist on UART4 and UART5.</p>

22 Internal integrated circuit interface (I2C)

22.1 Full name and abbreviation description of terms

Table 89 Full name and abbreviation description of terms

Full name in English	English abbreviation
Serial Data	SDA
Serial Clock	SCL
System Management Bus	SMBus
Clock	CLK
Serial Clock High	SCLH
Serial Clock Low	SCLL
Address Resolution Protocol	ARP
Negative Acknowledgement	NACK
Packet Error Checking	PEC
Address Resolution Protocol	ARP

22.2 Introduction

I2C is a short-distance bus communication protocol. In physical implementation, I2C bus is composed of two signal lines (SDA and SCL) and a ground wire.

These two signal lines can be used for bidirectional transmission.

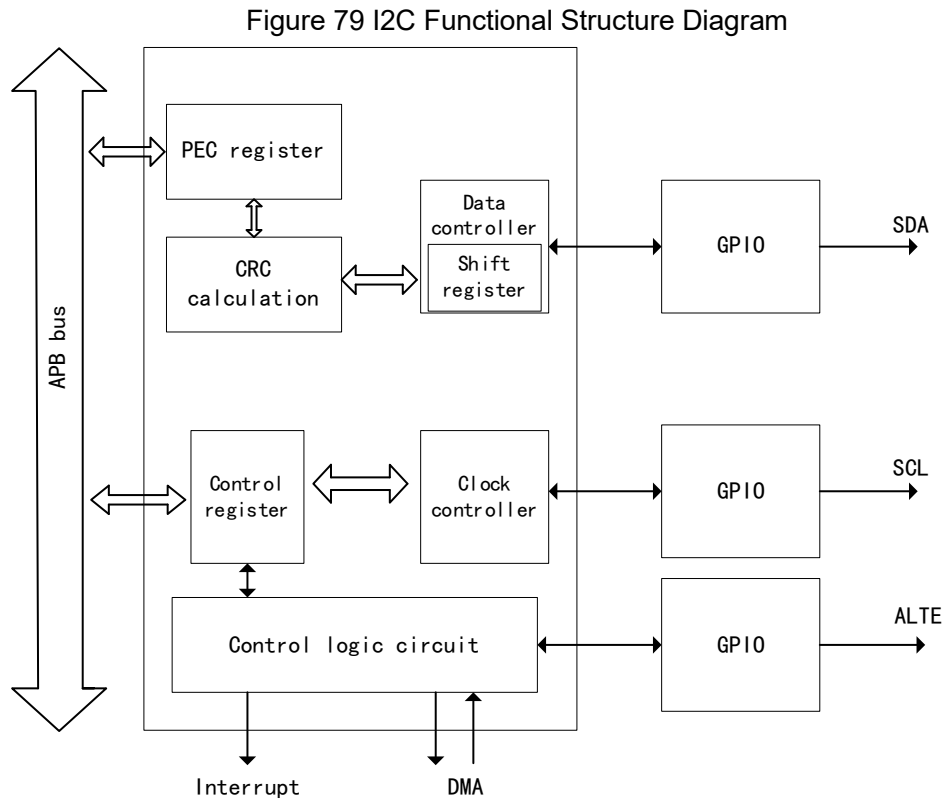

- Two signal lines, SCL clock line and SDA data line. SCL provides timing for SDA, and SDA transmits/receives data in series
- Both SCL and SDA signal lines are bidirectional
- The ground is common when the two systems use I2C bus for communication

22.3 Main characteristics

- (1) Multi-master function
- (2) The master can generate the clock, start bit and stop bit
- (3) Slave function
 - Programmable I2C address detection
 - Double-address mode
 - Detection stop bit
- (4) 7-bit and 10-bit addressing mode
- (5) Response to broadcast

- (6) Two communication speeds
 - Standard mode
 - Fast mode
- (7) Programmable clock extension
- (8) State flag
 - Transmitter/Receiver mode flag
 - Flag for end of byte transmission
 - Flag of busy bus
- (9) Error flag
 - Arbitration loss
 - Acknowledgment error
 - Wrong start bit or stop bit detected
- (10) Interrupt source
 - Address/Data communication succeeded
 - Error interrupt
- (11) Support DMA function
- (12) Programmable PEC
 - Final transmission in transmission mode
 - PEC error check after the last byte is received
- (13) SMBus specific function
 - Hardware PEC
 - Address resolution protocol

22.4 Structure block diagram

The interface can be configured to the following modes:

- Slave transmitting
- Slave receiving
- Master transmitting
- Master receiving

In the initial state of I2C interface, the working mode is slave mode. After I2C interface transmits the start signal, it will automatically switch from slave mode to master mode.

22.5 Functional description

Table 90 Description of Special Terms of I2C Bus

Special terms	Description
Transmitter	Device transmitting data to the bus
Receiver	Device receiving data from the bus
Master	Device that initiates data transmission, generates clock signals and ends data transmission
Slave	Device addressed by master

Special terms	Description
Multiple masters	Multiple masters that control the bus at the same time without destroying information
Synchronous	The process of synchronizing the clock signals between two or more devices
Arbitration	If more than one master tries to control the bus at the same time, only one master can control the bus, and the information of the controlled master will not be destroyed

22.5.1 I2C physical layer

The commonly used connection modes between I2C communication devices are shown in the figure below:

Figure 80 Commonly Used I2C Communication Connection Diagram

Characteristics of physical layer:

- (1) Bus supporting multiple devices (signal line shared by multiple devices), which, in I2C communication bus, can connect multiple communication masters and communication slaves.
- (2) An I2C bus only uses two bus lines, namely, a bidirectional serial data line (SDA) and a serial clock line (SCL). The data line is used for data transmission, and the clock line is used for synchronous receiving and transmission of data.
- (3) Each device connected to the bus has an independent address (seven or ten bits), and the master addresses and accesses the slave device according to the address of the device.
- (4) The bus needs to connect the pull-up resistor to the power supply. When I2C bus is idle, the output is in high-impedance state. When all devices are idle, the output is in high-impedance state, and the pull-up resistor pulls the bus to high level.

- (5) Three communication modes: Standard mode (up to 100KHz), fast mode (up to 400KHz), and fast mode plus (up to 1MHz).
- (6) When multiple masters use the bus at the same time, to prevent the data collision, the bus arbitration mode is adopted to determine which device occupies the bus.
- (7) Can program setup and hold time, and program the high-level time and low-level time of SCL in I2C.

22.5.2 I2C protocol layer

Characteristics of protocol layer

- (1) Data is transmitted in the form of frame, and each frame is composed of 1 byte (8 bits).
- (2) In the rising edge phase of SCL, SDA needs to keep stable and SDA changes during the period when SCL is low.
- (3) In addition to data frame, I2C bus also has start signal, stop signal and acknowledge signal.
 - Start bit: During the stable high level period of SCL, a falling edge of SDA starts transmission.
 - Stop bit: During the stable high level period of SCL, a rising edge of SDA stops transmission.
 - Acknowledge bit: Used to indicate successful transmission of one byte. After the bus transmitter (regardless of the master or slave) transmits 8-bit data, SDA will release (from output to input). During the ninth clock pulse, the receiver will pull down SDA to respond to the received data.

I2C communication reading and writing process

Figure 81 Master Writes Data to Slave

Figure 82 Master Reads Data from Slave

Remarks:

- (1) : This data is transmitted from master to slave
- (2) S: Start signal
- (3) SLAVE ADDRESS: Slave address
- (4) : This data is transmitted from slave to master
- (5) R/W: Selection bit of transmission direction
- (6) 1 means read
- (7) 0 means write
- (8) P: Stop signal

After the start signal is generated, all slaves will wait for the slave address signal sent by the master. In I2C bus, the address of each device is unique. When the address signal matches the device address, the slave will be selected, and the unselected slave will ignore the future data signal.

When the master direction is writing data

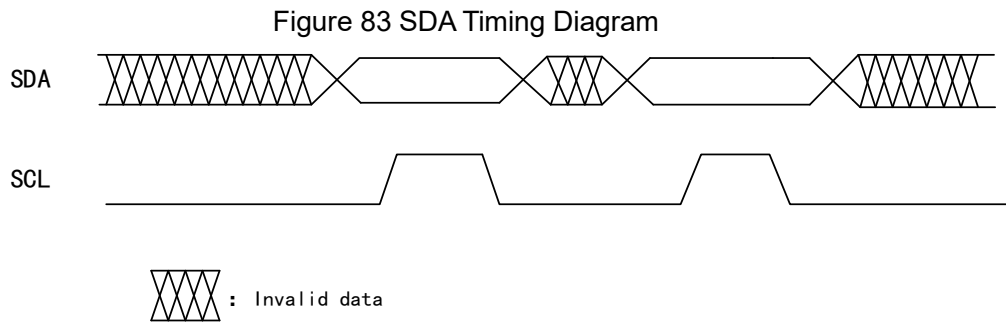

After broadcasting the address and receiving the acknowledge signal, the master will transmit data to the slave, the data length is one byte, and every time the master transmits one byte of data, it needs to wait for the answer signal transmitted by the slave. After all the bytes have been transmitted, the master will transmit a stop signal (STOP) to the slave, indicating that the transmission is completed.

When the master direction is reading data

After broadcasting the address and receiving the acknowledge signal, the slave will transmit the data to the master. The size of the data package is 8 bits. Every time the slave transmits one byte of data, it needs to wait for the acknowledge signal of the master. When the master wants to stop receiving data, it needs to return a non-acknowledge signal to the slave, then the slave will stop transmitting the data automatically.

22.5.3 Data validity

In the process of data transmission, the data on SDA line must be stable when the clock signal SCL is at high level. Only when the SCL is at the low level, can the level state of SDA be changed, and the bit transmission of each data needs a clock pulse.

22.5.4 Start and stop signals

All data transmission must have start signal (START) and stop signal (STOP).

Figure 84 START signal is defined as: when SCL is at high level, SDA will convert from high level to low level

Figure 85 STOP signal is defined as: when SCL is at high level, SDA will convert from low level to high level

22.5.5 Arbitration

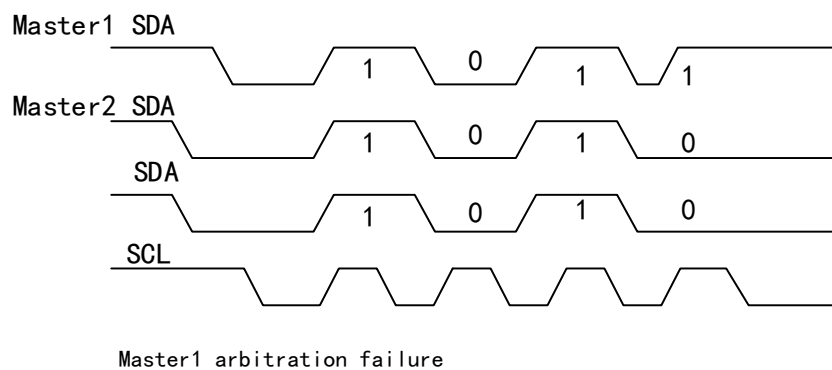

Arbitration is also used to solve the bus control conflict in case of multiple masters. The arbitration process takes place on the master and has nothing to do with the slave.

The master can start transmission only when the bus is idle. Two masters may generate an effective START signal on the bus within the shortest hold time of the START signal. In this situation, it is required that arbitration should decide

which master completes the transmission.

Arbitration is conducted by bit. During each arbitration, when SCL is high, each master will check whether the SDA level is the same as that sent by itself. The arbitration process needs to last for many bits. Theoretically, if two masters transmit exactly the same content, they can successfully transmit without arbitration failure. If one master transmits high level, but it is detected that SDA is at low level, an arbitration failure error will occur, the SDA output of the master will be disabled, and the other master will complete its own transmission.

Figure 86 SDA Timing Diagram

Master1 arbitration failure

22.5.6 SMBus specific function

System management bus (SMBus) is a simple single-end double-wire bus, which can meet the requirements of lightweight communication.

SMBus is commonly used in computer motherboard, mainly for power transmission ON/OFF instructions. SMBus is the derivative bus of I2C. It is mainly used for communication of low-bandwidth devices on computer motherboard, and power-related chip.

Address resolution protocol

SMBus specification includes an address resolution protocol, which can realize dynamic address assignment. Dynamic recognition hardware and software enable the bus to support hot plugging, and the bus devices will be automatically identified and assigned with a unique address.

SMBus alarm

SMBus alarm is an optional signal with an interrupt line for pins that are sacrificed to extend their control ability.

22.5.7 Error flag bit

Table 91 The following several error flag bits exist in I2C communication

Error flag bit	Description of error flag bit
Answer error flag bit (AEFLG)	No answer received
Bus error flag bit (BERRFLG)	An external stop or start condition is detected
Arbitration loss flag bit (ALFLG)	Arbitration loss is detected by the interface
Overrun/Underrun error flag bit (OVRURFLG)	In slave mode, the received data is not read out, the next data has arrived, and an overrun error occurs. The transmitting data clock has arrived, but the data has not been written into the DATA register, and an underrun error occurs.
Timeout or Tow error flag bit (TTEFLG)	SCL is pulled down for more than a certain time
PEC comparison error flag bit (PECEFLG)	CRC values are not equal

22.5.8 Message error check (PEC)

I2C module has a PEC module, which checks the message of I2C data by CRC-8 calculator. The CRC-8 polynomial used by the calculator is: $C(x) = X^8 + X^2 + X + 1$.

When PECEN bit is set to 1 and PEC function is enabled, PEC module will calculate all data sent by I2C bus, including address data.

22.5.9 DMA mode

According to the software process of I2C, when the transmit register is empty or the receive register is full, MCU needs to write or read bytes, then we can complete the operation more quickly through the DMA function of I2C.

DMA transmission

Set the DMAEN bit in I2C_CTRL2 register to enable the DMA mode. When the transmit register is empty (TXBEFLG is set to 1), the data will be directly loaded from the memory area to the DATA register through DMA.

DMA receiving

Set DMAEN in I2C_CTRL2 register to enable DMA mode. When the receiving register is full (RXBNEFLG is set to 1), DMA will transmit DATA register data to the set storage area.

22.5.10 I2C interrupt

Table 92 I2C Interrupt Request

Interrupt event	Event flag bit	Interrupt control bit
Transmitting start bit completed	STARTFLG	EVIEN
Transmission completed/Address matching address signal	ADDRFLG	
10-bit address head segment transmission completed	ADDR10FLG	
Received stop signal	STOPFLG	
Data byte transmission completed	BTCFLG	
Receive buffer not empty	RXBNEFLG	EVIEN and BUFIEN
Transmit buffer empty	TXBEFLG	
Bus error	BERRFLG	ERRIEN
Arbitration loss	ALFLG	
Answer failed	AEFLG	
Overrun/Underrun	OVRURFLG	
PEC error	PECEFLG	
Timeout or Tlow error	TTEFLG	
SMBus reminder	ALERTEN	

22.6 Register address mapping

Table 93 I2C Register Address Mapping

Register name	Description	Offset address

Busy	BSY

23.2 Introduction

SPI interface can be configured to support SPI protocol and I2S audio protocol. It works in SPI mode by default, and the functions can be switched in I2S mode through software.

Serial peripheral interface (SPI) provides data transmitting and receiving functions based on SPI protocol, which allows chips to communicate with external devices in half duplex, full duplex, synchronous and serial modes, and can work in master or slave mode.

The on-chip audio interface (I2S) supports four audio standards: Philips I2S standard, MSB alignment standard, LSB alignment standard and PCM standard. It can work in master/slave mode of half-duplex communication.

23.3 Main characteristics

23.3.1 Main characteristics of SPI

- (1) Master and slave operation with 3-wire full duplex synchronous transmission and receiving
- (2) Simplex synchronous transmission can be realized by two wires (the third bidirectional data line can be included/not included)
- (3) Select 8-bit or 16-bit transmission frame format
- (4) Support multiple master device mode
- (5) Support special transmission and receiving mark and can trigger interrupt
- (6) Have SPI bus busy state flag
- (7) The SPI communication rate is up to 42Mbit/s
- (8) Clock polarity and phase are programmable
- (9) Data sequence is programmable; select MSB or LSB first
- (10) Interrupt can be triggered by master mode fault, overrun and CRC error flag
- (11) Have DMA transmit and receive buffers
- (12) SPI TI mode
- (13) Calculation, transmission and verification can be conducted through hardware CRC

23.3.2 Main characteristics of I2S

- (1) Have master/slave mode of simplex communication (only transmit/receive)
- (2) Four audio standards
 - I2S Philips standard
 - MSB alignment standard
 - LSB alignment standard
 - PCM standard
- (3) 16/24/32-bit data length can be selected
- (4) 16-bit or 32-bit channel length
- (5) Clock polarity is programmable
- (6) 16-bit data register is used for transmitting and receiving

- (7) MSB is always the first in the data direction
- (8) Transmitting and receiving supports DMA function

23.4 SPI functional description

23.4.1 Description of SPI signal line

Table 95 SPI Signal Line Description

Pin name	Description
SCK	Master device: SPI clock outputs Slave device: SPI clock inputs
MISO	Master device: Input the pin and receive data Slave device: Output the pin and transmit data Data direction: From slave device to master device
MOSI	Master device: Output the pin and transmit data Slave device: Input the pin and receive data Data direction: From master device to slave device
NSS	Software NSS mode: NSS pin can be used for other purposes. NSS mode of master device hardware: NSS output, single master mode. NSS closed output: Operation of multiple master environments is allowed. NSS mode of slave device hardware: NSS signal is set to low level as chip selection signal of slave.

23.4.2 Phase and polarity of clock signal

The clock polarity and clock phase are CPOL and CPHA bits of SPI_CTRL1 register.

Clock polarity CPOL means the level signal of SCK signal line when SPI is in idle state.

- When CPOL=0, SCK signal line is in idle state and at low level
- When CPOL=1, SCK signal line is in idle state and at high level

Clock phase CPHA means the sampling moment of data

- When CPHA=0, the signal on MOSI or MISO data line will be sampled by the "odd edge" on SCK clock line.
- When CPHA=1, the signal on MOSI or MISO data line will be sampled by the "even edge" on SCK clock line.

SPI can be divided into four modes according to the states of clock phase CPHA and clock polarity CPOL.

Table 96 Four Modes of SPI

SPI mode	CPHA	CPOL	Sampling moment	Idle SCK clock
0	0	0	Odd edge	Low level
1	0	1	Odd edge	High level

SPI mode	CPHA	CPOL	Sampling moment	Idle SCK clock
2	1	0	Even edge	Low level
3	1	1	Even edge	High level

23.4.3 Data frame format

Set MSB or LSB to be first by configuring LSBSEL bit in SPI_CTRL1 register. Select to transmit/receive in 8/16-bit data frame format by configuring DFLSEL bit in SPI_CTRL1 register.

23.4.4 NSS mode

Software NSS mode: Select to enable or disable this mode by configuring SSEN bit of SPI_CTRL1 register, and the internal NSS signal level is driven by ISSEL bit of SPI_CTRL1 register.

Hardware NSS mode:

- Turn on NSS output: When SPI is in master mode, enable SSOEN bit, NSS pin will be pulled to low level and SPI will automatically enter the slave mode.
- Turn off NSS output: Operation is allowed in multiple master environments.

23.4.5 SPI mode

23.4.5.1 SPI master mode

In master mode, generate serial clock on SCK pin

Master mode configuration

- Configure MSMSEL=1 in SPI_CTRL1 register
- Select the polarity and phase by configuring CPOL and CPHA bits in SPI_CTRL1 register.
- Select 8/16-bit data frame format by configuring DFLSEL bit in SPI_CTRL1 register
- Select LSB or MSB first by configuring LSBSEL in SPI_CTRL1 register
- NSS configuration:
 - NSS pin works in input mode: in hardware mode, it is required to connect NSS pin to high level during the entire data frame transmission; in software mode, it is required to set SSEN bit and ISSEL bit in SPI_CTRL1 register
 - NSS works in output mode and it is required to configure SSOEN bit of SPI_CTRL2 register
- Configure FRFCFG bit of SPI_CTRL2 register to select TI mode protocole for serial communication
- Enable SPI by configuring SPIEN bit in SPI_CTRL1 register

In master mode: MOSI pin is data output, which MISO is data input

TI protocol

In slave mode, SPI interface supports TI protocol. It is controlled by FRFCFG bit of SPI_CTRL2 register. Both clock polarity and phase position conform to TI protocol. NSS management is specific to TI protocol, not needing to configure SPI_CTRL1 and SPI_CTRL2 registers.

23.4.5.2 SPI slave mode

In slave mode, SCK pin receives the serial clock transmitted from the master device

Configuration of slave mode

- Configure MSMSSEL=0 in SPI_CTRL1 register
- Select the polarity and phase by configuring CPOL and CPHA bits in SPI_CTRL1 register.
- Select 8/16-bit data frame format by configuring DFLSEL bit in SPI_CTRL1 register
- Select LSB or MSB first by configuring LSBSEL in SPI_CTRL1 register
- NSS configuration:
 - In hardware mode: NSS pin must be at low level in the whole data frame transmission process
 - In software mode: Set SSEN bit in SPI_CTRL1 register and clear ISSEL bit (this step is not required for TI mode)
- Configure FRFCFG bit of SPI_CTRL2 register to select TI mode protocol for serial communication
- Enable SPI by configuring SPIEN bit in SPI_CTRL1 register

In slave mode: MOSI pin is data input, which MISO is data output

TI protocol

In slave mode, SPI interface supports TI protocol. It is controlled by FRFCFG bit of SPI_CTRL2 register. Both clock polarity and phase position conform to TI protocol. NSS management is specific to TI protocol, not needing to configure SPI_CTRL1 and SPI_CTRL2 registers.

In slave mode, SPI baud rate prescaler can use any baud rate to control the moment of switching MISO pin state to high-impedance state, so it can determine this moment very flexibly. The baud rate is generally the baud rate of external master clock. The baud rate value set by BRSEL[2:0] of SPI_CTRL1 register and the internal circuit of the chip synchronously determine the time when the MISO pin state changes to high-impedance state.

23.4.5.3 Half-duplex communication of SPI

One clock line and one bidirectional data line

- Enable this mode by setting BMEN of SPI_CTRL1 register
- Control the data line to be input or output by setting BMOEN bit of SPI_CTRL1 register
- SCK pin is used as clock, MOSI pin is used in master device to transmit data, and MISO pin is used in slave device to transmit data

23.4.6 Data transmitting and receiving process in different SPI modes

Table 97 Run Mode of SPI

Mode	Configure	Data pin
Full duplex mode of master device	BMEN=0, RXOMEN=0	MOSI transmits; MISO receives
Unidirectional receiving mode of master device	BMEN=0, RXOMEN=1	MOSI is not used; MISO receives
Bidirectional transmitting mode of master device	BMEN=1, BMOEN=1	MOSI transmits; MISO is not used
Bidirectional receiving mode of master device	BMEN=1, BMOEN=0	MOSI is not used; MISO receives
Full duplex mode of slave device	BMEN=0, RXOMEN=0	MOSI receives, and MISO transmits
Unidirectional receiving mode of slave device	BMEN=0, RXOMEN=1	MOSI receives, while MISO is not used
Bidirectional transmitting mode of slave device	BMEN=1, BMOEN=1	MOSI is not used, and MISO transmits
Bidirectional receiving mode of slave device	BMEN=1, BMOEN=0	MOSI receives, while MISO is not used

Figure 87 Connection in Full Duplex Mode

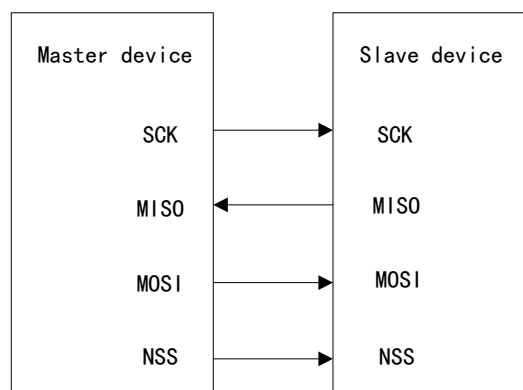

Figure 88 Connection in Half-duplex Mode (the master is used for receiving, while the slave is used for transmitting)

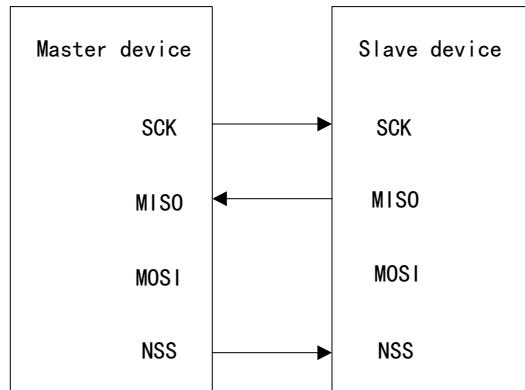

Figure 89 Connection in Half-duplex Mode (the master only transmits, while the slave receives)

Figure 90 Bidirectional Line Connection

23.4.6.1 Transmitting and receiving of processed data

Data transmission

After the mode configuration is completed, the SPI module is enabled to remain idle.

Master mode: The software writes a data frame to the transmit buffer, and the transmission process starts

Slave mode: The SCK signal on the SCK pin starts to jump, while the NSS pin level is low, and the transmission process starts (before starting data transmission, make sure that the data has been written to the transmit buffer in advance).

When SPI is transmitting a data frame, it will load the data frame from the data buffer to the shift register, and then start to transmit data. After one bit of data frame is sent, TXBEFLG is set to 1. If you need to continue to transmit data, the software needs to wait until TXBEFLG=1 writes data to the SPI_DATA register. (TXBEFLG flag is set to 1 by hardware and cleared by software).

Data receiving

BSYFLG flag is always set to 1 in the data transmission process.

At the last edge of the sampling clock, the received data is transferred from the shift register to the receive buffer; set the RXBNEFLG flag, and the software reads the data in data register (SPI_DATA) to obtain the content of the receive buffer; if RXBNEIEN bit of SPI_CTRL2 register is set, an interrupt will be generated, and after data is read, the BSYFLG flag will be automatically cleared.

23.4.6.2 Full duplex transmitting and receiving mode in master/slave device

Full duplex mode in master device

- After writing data to SPI_DATA register (transmit buffer), data transmission starts.
- When SPI transmits the first bit of data, the data is transferred from the transmit buffer to the shift register and then transferred to the MOSI pin serially according to the sequence.
- The data received on MISO pin is serially transferred to SPI_DATA register (receive buffer) according to the sequence.

Transmitting and receiving are synchronous.

Full duplex mode under slave device

- When the slave device receives the clock signal and the first data bit appears on the MOSI pin, data transmission starts, and the subsequent data bits will be transferred to the shift register in turn.
- When SPI transmits the first bit of data, the data is transferred from the transmit buffer to the shift register, and then transferred to the MISO pin serially according to the sequence.
- The software must ensure that the data to be sent is written before the SPI master device starts to transmit data.

Transmitting and receiving are synchronous.

Full duplex transmitting and receiving process under master/slave device

- (1) Enable SPI module: Configure SPIEN=1 of SPI_CTRL1 register.
- (2) Write the first data to be sent to SPI_DATA register, and the TXBEFLG flag will be cleared.
- (3) Wait until TXBEFLG flag bit is set to 1 (control by hardware), and write the second data bit to be sent.
- (4) Wait until RXBNEFLG flag bit is set to 1 (control by hardware), read the first received data in the SPI_DATA register, at the same time, clear the RXBNEFLG flag (cleared by software). Repeat the operation, and transmit and receive data at the same time.
- (5) Wait until RXBNEFLG=1 and receive the last data.
- (6) Wait until TXBEFLG=1 and close SPI module after BSYFLG=0.

23.4.6.3 Bidirectional transmitting mode of master/slave device

Bidirectional transmission of master device

- Write data to SPI_DATA register, and the transmission starts
- The data in the transmit buffer is transferred to the shift register in parallel, and then transferred to the MOSI pin serially according to the sequence.

Bidirectional transmission of slave device

- When the slave device receives the clock signal and the first data bit appears on the MISO pin, data transmission starts.
- At the same time, the data to be sent by the transmit buffer is transferred to the shift register in parallel, and then sent to the MISO pin in serial (before data transmission, make sure that the data has been written to the transmit buffer in advance).

Bidirectional transmission process of master/slave device

- (1) Enable SPI module: Configure SPIEN=1 of SPI_CTRL1 register.
- (2) Write the first data to be sent to SPI_DATA register, and the TXBEFLG flag will be cleared.
- (3) Wait until TXBEFLG=1, write the second data, repeat the operation and transmit the subsequent data
- (4) After writing the last data, wait for TXBEFLG=1 and BSYFLG=0 and transmission is completed

23.4.6.4 One-way/Two-way receiving mode under master/slave device

- (1) Enable SPI module: Configure SPIEN=1 of SPI_CTRL1 register.

- (2) In the master device: Generate SCK clock immediately, and continuously receive data before SPI is disabled.
- (3) Slave device: When SPI master device pulls down NSS and generates clock, receive data.
- (4) Wait until the RXBNEFLG flag is set to 1, read data through SPI_DATA, and repeat the operation to receive data.

23.4.7 CRC functions

SPI module contains two CRC computing units, which are used for data receiving and data transmission respectively.

CRC computing unit is used to define polynomials in SPI_CRCPOLY register.

Enable CRC computing by configuring CRCEN bit in SPI_CTRL1 register; at the same time, reset the CRC register (SPI_RXCRC and SPI_TXCRC).

To obtain the CRC value of transmission calculation, after the last data is written to the transmit buffer, it is required to set CRCNXT bit of SPI_CTRL1; indicate that the hardware transmits the CRC value after the last data is sent, and the CRCNXT bit will be cleared; at the same time, compare the values of CRC and SPI_RXCRC, and if they do not match, it is required to set CRCEFLG bit of SPI_STS register, and after ERRIEN bit of SPI_CTRL2 register is set, an interrupt will occur.

Note:

- (1) If SPI is under slave device and CRC function is used, CRC computing will continue when NSS pin is at high level. For example, when the master device communicates with multiple slave devices alternately, the above situation will occur, so it is necessary to avoid faulty operation of CRC.
- (2) In the process of a slave device from being unselected (NSS is at high level) to being selected (NSS is at low level 0), it is required to clear the CRC value at both ends of the master and slave devices to keep the next CRC computing results of the master and slave devices synchronized.
- (3) When SPI is in slave mode, CRC computing can be enabled after the clock is stable.
- (4) When the SPI clock frequency is too high, the CPU operation will affect the SPI bandwidth. It is recommended to use DMA mode to avoid the reduction of SPI speed.
- (5) When the SPI clock frequency is too high, during the CRC transmission period, the CPU utilization frequency is reduced, and the function call is disabled in the CRC transmission process to avoid errors when receiving the last data and CRC.
- (6) When NSS hardware mode is used in slave mode, NSS pin should be kept low during data transmission and CRC transmission period.

Sequence of clearing CRC values

- (1) Disable SPI (SPIEN=0)
- (2) Clear CRCEN bit
- (3) Set CRCEN bit to 1
- (4) Enable SPI (SPIEN=1)

23.4.8 DMA function

For high-speed data transmission, the request/response DMA mechanism in SPI improves the system efficiency and can transfer data to SPI transmit buffer promptly, and the receive buffer can read the data in time to prevent overflow.

When SPI only transmits data, it is only needed to enable DMA transmission channel; when SPI only receives data, it is only needed to enable DMA receiving channel.

DMA function of SPI mode can be enabled by configuring TXDEN and RXDEN bits of SPI_CTRL2 register.

- When transmitting: When TXBEFLG flag bit is set to 1, issue the DMA request, DMA controller writes data to SPI_DATA register, and then the TXBEFLG flag bit will be cleared.
- When receiving: When setting RXBNEFLG flag bit to 1, issue the DMA request, DMA controller reads data from SPI_DATA register, and then RXBNEFLG flag bit is cleared.

By monitoring BSYFLG flag bit, confirm whether SPI communication is over after DMA has transferred all data to be sent in transmitting mode, which can avoid damaging the transmission of last data.

DMA function with CRC

By the end of communication, if SPI enables both CRC operation and DMA function, transmitting and receiving of CRC bytes will be completed automatically.

At the end of data and CRC transmission, if CRCEFLG flag bit of SPI_STS register is set to 1, it indicates that an error occurred during transmission.

23.4.9 Disable SPI

After data transmission is over, end the communication by closing SPI module. In some configurations, if SPI is disabled before data transmission is completed, data transmission error may be caused. Different methods are required in different operation modes to close SPI

Maser mode/full-duplex slave mode

- (1) Wait until RXBNEFLG flag bit is set to 1, and receive the last data

- (2) Wait until TXBEFLG flag bit is set to 1
- (3) Wait for clearing BSYFLG flag bit
- (4) Close SPI (set SPIEN=0 of SPI_CTRL1 register)

One-way transmit-only/bidirectional transmitting mode of master mode/slave mode

After the last data is written into SPI_DATA register:

- (1) Wait until TXBEFLG flag bit is set to 1
- (2) Wait for clearing BSYFLG flag bit
- (3) Close SPI (set SPIEN=0 of SPI_CTRL1 register)

One-way receive-only/bidirectional receiving mode of master mode/slave mode

- (1) Wait No. n-1 RXBNEFLG flag bit is set to 1
- (2) Wait for one SPI clock cycle before SPI is disabled (set SPIEN=0 of SPI_CTRL1 register)
- (3) Before entering the stop mode, wait until the last RXBNEFLG flag bit is set to 1

Receive-only/bidirectional receiving mode in slave mode

SPI can be disabled at any time (set SPIEN=0 of SPI_CTRL1 register) and it will be disabled when the transmission is over. If you want to enter the stop mode, wait until BSYFLG flag bit is cleared.

23.4.10 SPI interrupt

23.4.10.1 State flag bit

Transmit buffer empty flag TXBEFLG

TXBEFLG=1 indicates that the transmit buffer bit is empty, and the next data to be sent can be written. When the data is written to SPI_DATA register, clear the TXBEFLG flag bit.

Receive buffer non-empty flag RXBNEFLG

RXBNEFLG=1 indicates that the receive buffer contains valid data and the data can be read through SPI_DATA register; and the RXBNEFLG flag can be cleared.

Busy flag BSYFLG

BSYFLG flag is set and cleared by hardware, which can indicate the state of

SPI communication layer. When BSYFLG=1, it indicates SPI is communicating, but in the two-line receiving mode under the master device, BSYFLG=0 during the period of receiving of data.

BSYFLG flag can be used to detect whether transmission is over to avoid damaging the last transmitted data.

BSYFLG flag bit can be used to avoid conflict when writing data in multi-master mode.

BSYFLG flag will be cleared when the transmission ends (except for continuous communication in master mode), SPI is disabled and the master mode fails.

BSYFLG=0 between data item and data item when communication is discontinuous.

When communication is continuous:

- In master mode: BSYFLG=1 in the whole transmission process
- In slave mode: BSYFLG is kept low within one SCK clock cycle between transmission of each data

Note: It is best to use TXBEFLG and RXBNEFLG flags to process the transmitting and receiving of each data item.

23.4.10.2 Error flag bit

Master mode error MEFLG

MEFLG is an error flag bit. The master mode error occurs when: in hardware NSS mode, the NSS pin of the master device is pulled down; in software NSS mode, ISSEL bit is cleared; MEFLG bit is set automatically.

Influence of master mode failure: MEFLG is set to 1, and SPI interrupt is generated when ERRIEN is set; SPIEN is cleared (output stops, SPI interface is disabled); MSMSEL is cleared and the device is forced into the slave mode.

Operation of clearing the MEFLG flag bit: When MEFLG bit is set to 1, it is required to read or write SPI_STS register, and then write to SPI_CTRL1 register.

When MEFLG flag bit is 1, it is not allowed to set SPIEN and MSMSEL bits.

Overrun error OVRFLG

Overrun error: After the master device transmits the data, the RXBNEFLG flag bit is still 1, which indicates that the overrun error occurred. Then OVRFLG bit is set to 1, and if the ERRIEN bit is also set, an interrupt will be generated.

After an overrun error occurs, the data in the receive buffer is not the data sent by the master device, and then the read data in SPI_DATA register is the data not read before, while the data sent later will not be read.

OVRFLG flag can be cleared by reading SPI_DATA register and SPI_STS register according to the sequence.

CRC error flag CRCEFLG

By setting CRCEN bit of SPI_CTRL1 register, start CRC computing, CRC error flag, and check whether the received data is valid.

When the value sent by SPI_TXCRC register does not match the value in SPI_RXCRC register, a CRC error will be generated, and CRCEFLG flag bit in SPI_STS register will be set to 1.

CRCEFLG can be cleared by writing 0 to CRCEFLG bit of SPI_STS register.

TI frame format error flag FREFLG

If SPI supports TI protocol in slave mode, TI frame format error will be detected when NSS pulse occurs during communication. When this error appears, SPI_STS[FREFLG]=1, SPI will not be disabled, but NSS pulse will be ignored, and SPI will start new transmission when next NSS pulse arrives. As the error detection may cause the loss of two data bytes, the data may have been damaged.

FREFLG flag will be cleared when reading SPI_STS register. If ERRIEN=1, and a frame format error is detected, an interrupt will be generated. The continuity of data cannot be guaranteed at this time, the SPI shall be disabled and after the slave SPI is enabled again, the master will restart the communication.

Table 98 SPI Interrupt Request

Interrupt flag	Interrupt event	Enable control bit	Clearing method
TXBEFLG	Transmit buffer empty flag	TXBEIEN	Write SPI_DATA register
RXBNEFLG	Receive buffer non-empty flag	RXBNEIEN	Read SPI_DATA register
MEFLG	Master mode failure event	ERRIEN	Read/Write SPI_STS register, and then write SPI_CTRL1 register
OVRFLG	Overrun error		Read SPI_DATA register, and then read SPI_STS register
CRCEFLG	CRC error flag		Write 0 to CRCEFLG bit
FREFLG	TI frame format error		Read SPI_STS register

23.5 I2S functional description

Enable I2S function by setting I2SMOD bit of SPI_I2SCFG.

I2S and SPI share four pins:

- SD: Serial data, transmitting and receiving the data of 2-way time division multiplexing channel
- WS: Chip selection, switching the data of left and right channels
- CK: Serial clock; the clock signal is output in master mode, and is input in slave mode
- MCK: Master clock; in master mode, when MCOEN bit of SPI_I2SPSC register is set to 1, it can be used as the pin for outputting the extra clock signal.

23.5.1 I2S full duplex

In addition to I2S2 and I2S3, two extended I2S can be also be used to support I2S full-duplex mode. Therefore, the first I2S full-duplex interface is based on I2S2 and I2S2_ext, and the second is based on I2S3 and I2S3_ext.

I2Sx can work in master mode:

- (1) Output SCK and WS in half-duplex mode
- (2) Provide SCK and WS for I2S2_ext and I2S3_ext in full-duplex mode

Extended I2S is only used for full-duplex mode and always works in slave mode. Both I2Sx and I2Sx_ext are used for transmitting and receiving.

23.5.2 I2S audio standard

I2S audio standard is selected by setting I2SSSEL bit and PFSSEL bit of SPI_I2SCFG register, and four audio standards can be selected: I2S Philips standard, MSB alignment standard, LSB alignment standard and PCM standard. Except PCM standard, other audio standards have two channels: left and right channels.

The data length and channel length can be configured by DATALEN and CHLEN bits in SPI_I2SCFG register. The channel length must be greater than or equal to the data length. There are four data formats to transmit data: 16-bit data packed into 16-bit frame, 16-bit data packed into 32-bit frame, 24-bit data packed into 32-bit frame, and 32-bit data packed into 32-bit frame.

When the 16-bit data is extended to 32 bits, the first 16 bits are valid data, and the last 16 bits are forced to be 0. No external intervention is needed in this process.

Since the data buffers used for transmitting and receiving are all 16 bits, SPI_DATA needs to read/write twice when 24-bit and 32-bit data are transmitted. If DMA is used, it needs to be transmitted twice.

For all communication standards and data formats, the most significant bit of data is always sent first.

For time division multiplexing, the left channel is always sent first, and then the

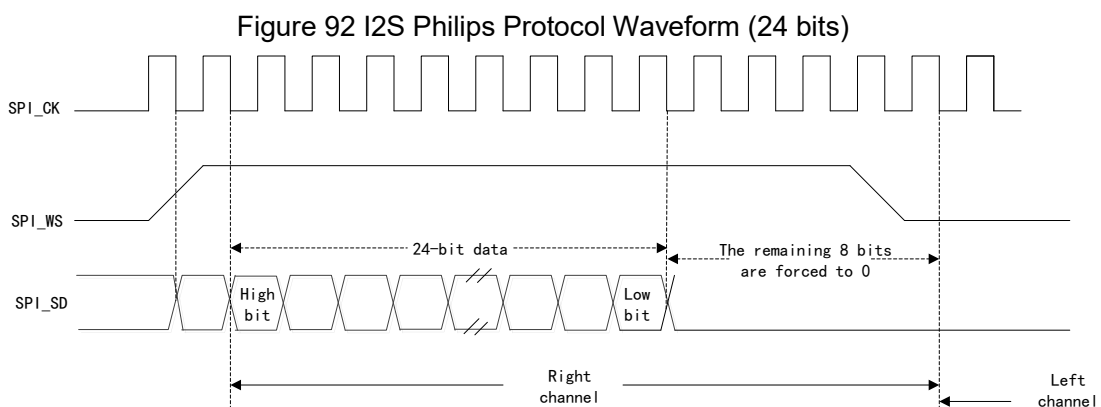

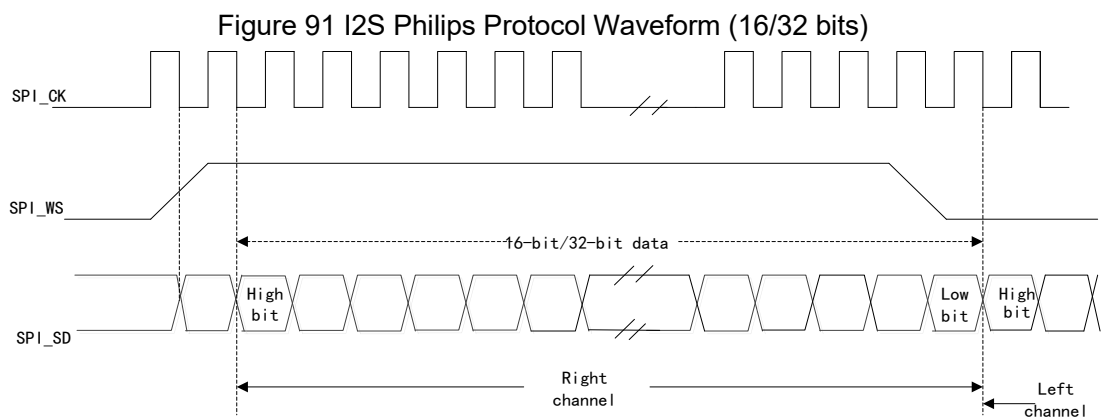

right channel is sent.

23.5.2.1 I2S Philips standard

In I2S Philips standard, the pin WS can indicate the data being sent comes from the left channel or the right channel.

In I2S Philips standard, both WS and SD change on the falling edge of CK clock signal.

The transmitter will change the data on the falling edge of the clock signal CK, while the receiver will change the data on the rising edge of the clock signal CK.

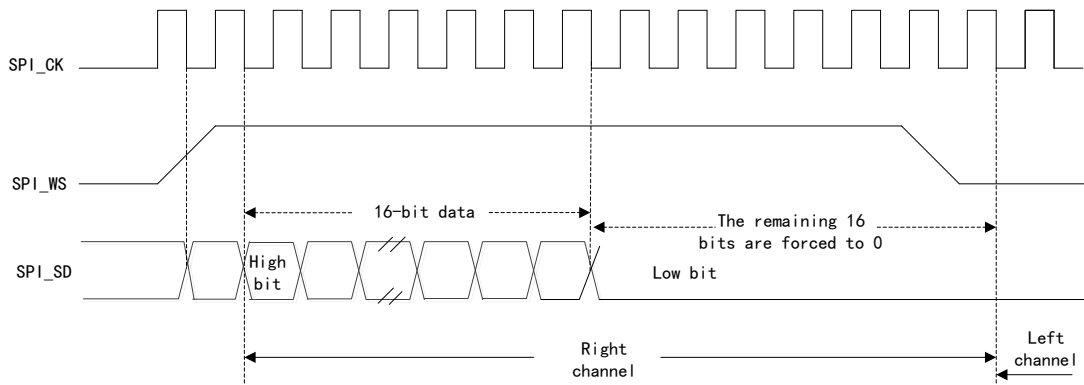

In I2S Philips standard, if you want to transmit/receive 24-bit and 32-bit data, the SPI_DATA register needs to read/write twice; for example:

- If you need to transmit 0x9FBB88 (24-bit data), write 0x9FBB to SPI_DATA register for the first time, and write 0x88XX to the register for the second time.
- If you need to receive 0x9FBB88 (24-bit data), read out 0x9FBB from SPI_DATA register for the first time and read out 0x8800 from the register for the second time.

In I2S configuration, when selecting the frame format of extending from 16-bit data to 32-bit data frame, it is required to access SPI_DATA register, and the remaining 16-bit data will be set to 0x0000 by hardware by force; for example:

- The data to be received or sent is 0x62d8, which becomes 0x62D80000 after it is expanded to 32 bits, and it is necessary to write 0x62D8 to SPI_DATA register or read out from SPI_DATA register.

Figure 93 I2S Philips Protocol Waveform (extending from 16 bits to 32 bits)

In the transmission process, the MSB should be written to the register SPI_DATA, and when TXBEFLG flag bit is set to 1, new data can be written; if there is corresponding interrupt, an interrupt can be generated.

In the receiving process, every time the MSB is received, the RXBNEFLG flag bit will be set to 1; if there is corresponding interrupt, an interrupt can be generated.

23.5.2.2 MSB alignment standard

In MSB standard, WS signal and the first data bit are generated at the same time

In the transmission process, the data is changed on the falling edge of the clock signal; in the receiving process, the data is read on the rising edge of the clock signal.

Figure 94 MSB Alignment Standard Waveform (16/32-bit data)

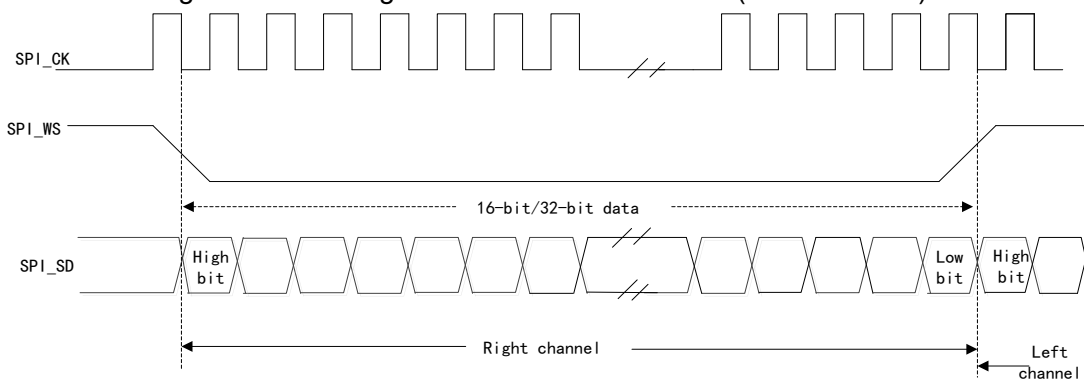

Figure 95 MSB Alignment Standard Waveform (24-bit data)

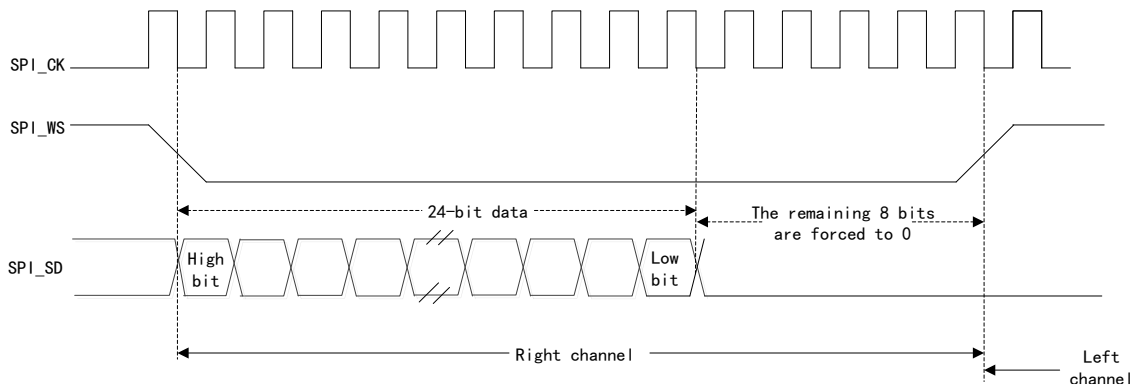

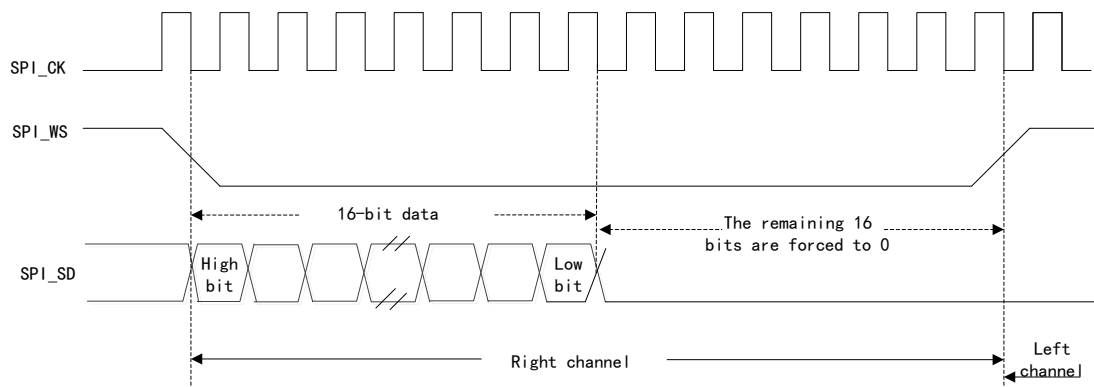

Figure 96 MSB Alignment Standard Waveform (extending from 16 bits to 32 bits)

23.5.2.3 LSB alignment standard

In the transmission process of LSB alignment standard, the data is changed on the falling edge of the clock signal; in the receiving process, the data is read on the rising edge of the clock signal. When the channel length is the same as the data length, the LSB alignment standard is the same as the MSB alignment standard. If the channel length is larger than the data length, the valid data of the LSB alignment standard is aligned with the lowest bit.

Figure 97 LSB Alignment Standard Waveform (16/32-bit data)

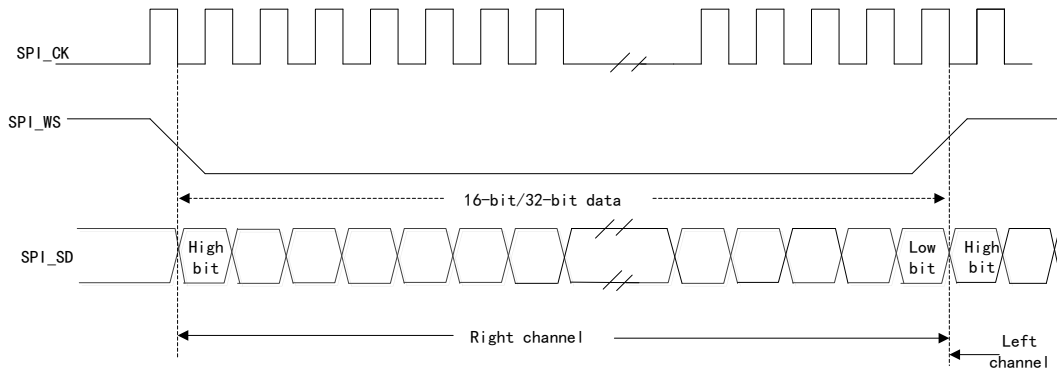

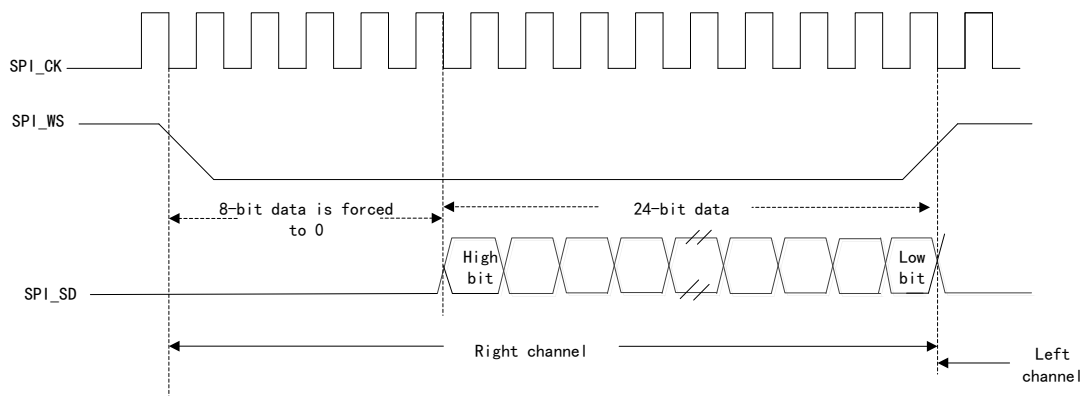

Figure 98 LSB Alignment Standard Waveform (24-bit data)

In the transmission process, if you want to transmit/receive 24-bit data, it is required to read/write the SPI_DATA register twice; for example:

- When you need to transmit 0x56EA98, write 0xXX56 to SPI_DATA register for the first time, and write 0xEA98 to SPI_DATA for the second time.
- When you need to receive 0x56EA98, read out 0x0056 from SPI_DATA register for the first time, and read out 0xEA98 from SPI_DATA register for the second time.

In I2S configuration, when selecting the frame format of extending from 16-bit data to 32-bit data frame, it is required to access SPI_DATA register, and the high 16-bit data will be set to 0x0000 by hardware by force; for example:

- The data to be received or sent is 0x98A5, which becomes 0x000098A5 after it is expanded to 32 bits, and it is necessary to write 0x98A5 to SPI_DATA register or read out from SPI_DATA register.

Figure 99 Under LSB Alignment Standard (extending from 16 bits to 32 bits)

23.5.2.4 PCM standard

There is no sound channel selection in PCM standard. Short frame and long frame of PCM standard are selected by configuring PFSSEL bit in SPI_I2SCFG register.

In the master mode, the valid time of synchronous WS signal of the long frame

structure is 13 bits.

Figure 100 PCM Standard Waveform

In the master mode, the length of the synchronous WS signal of the short frame structure is 1 bit.

Figure 101 PCM Standard Waveform

23.5.3 I2S clock

The clock source of I2SxCLK is system clock (HSICLK, HSECLK or PLL of AHB clock)

The bit rate of I2S determines the data stream on I2S data line and the clock signal frequency of I2S.

- I2S bit rate = the number of bits per channel × the number of sound channels × audio sampling frequency
- There are two channels of 16 bit audio signal: I2S bit rate=16×2×Fs

The relationship between audio sampling frequency (Fs) and I2S bit rate (I2S) is defined by the following formula:

Table 99 Audio Sampling Frequency (Fs) Formula

MCOEN	CHLEN	Audio sampling frequency (Fs)
1	0	$I2SxCLK / [(16 \times 2) \times ((2 \times I2SPSC) + ODDPSC) \times 8]$
1	1	$I2SxCLK / [(32 \times 2) \times ((2 \times I2SPSC) + ODDPSC) \times 4]$

MCOEN	CHLEN	Audio sampling frequency (Fs)
0	0	$I2SxCLK/[(16*2) * ((2*I2SPSC) + ODDPSC)]$
0	1	$I2SxCLK/[(32*2) * ((2*I2SPSC) + ODDPSC)]$

23.5.4 I2S mode

I2S can be configured as follows:

- (1) Transmit master or receive master of I2Sx is used in half-duplex mode
- (2) Master that receives and transmits concurrently in full-duplex mode

Table 100 I2S Run Mode

Run mode	SD	WS	CK	MCK
Master transmitting	Output	Output	Output	Output/Not used
Master receiving	Input	Output	Output	Output/Not used
Slave transmitting	Output	Input	Input	Output/Not used
Slave receiving	Input	Input	Input	Output/Not used

23.5.4.1 I2S master mode

When I2S works in master mode, the serial clock is output by pin CK, and the word select signal is generated by pin WS. It is controlled by SPI_I2SPSC[MCOEN] whether to output master clock.

Configuration process:

- (1) Configure I2SPSC bit and ODDPSC bit of SPI_I2SPSC register to define the baud rate of serial clock and the actual frequency division factor corresponding to the audio sampling frequency.
- (2) Configure CPOL bit of SPI_I2SCFG register to define the clock polarity of SPI in idle state.
- (3) Configure I2SMOD bit of SPI_I2SCFG register to activate I2S function and configure I2SMOD and PFSSEL bits of SPI_I2SCFG register to select I2S standard; configure DATALEN bit of SPI_I2SCFG register to select the data bits of the sound channel, and configure I2SMOD bit to select I2S master mode as transmitting terminal/receiving terminal.
- (4) Configure SPI_CTRL2 register to select to enable the interrupt and DMA function or not (select required or not).
- (5) Configure WS pin and CK pin to output mode; when MCOEN bit of SPI_I2SPSC is set to 1, the MCK pin should also be configured to output mode.
- (6) Set the running mode of I2S by configuring the I2SMOD bit of SPI_I2SCFG.
- (7) Set I2SEN bit of SPI_I2SCFG register to 1.

I2S master mode transmission process

When the data is written to the transmit buffer, the transmission will start, and the data will be transferred from the transmit buffer to the shift register, the TXBEFLG flag position is set to 1, and the SCHDIR flag bit indicates the corresponding sound channel of the currently transmitted data. And the value of SCHDIR flag bit will be updated when TXBEFLG flag bit is 1.

When transmitting the first bit of data, 16-bit data will be transferred to the 16-bit shift register in parallel, and then sent out from the pin MISO/SD in serial. The next data needs to be written to SPI_DATA register when TXBEFLG flag bit is 1. If TXBEIEN bit of SPI_CTRL2 is 1, an interrupt will be generated.

Before the completion of the current data transmission, write the next data to be transmitted to ensure continuous transmission of audio data.

When I2S is disabled, I2SEN can be cleared only when the flag bit TXBEFLG is 1 and BSYFLG is 0.

I2S master mode receiving process

RXBNEFLG flag is used to control the receiving sequence. RXBNEFLG flag indicates whether the receive buffer is empty; when the receive buffer is full, the RXBNEFLG flag bit will be set to 1. If RXBNEIEN bit of SPI_CTRL2 is configured, an interrupt will occur and after the user reads out the data from SPI_DATA register, the RXBNEFLG flag bit will be cleared. Make sure to receive new data after reading operation; otherwise, overrun will occur and the OVRFLG flag bit will be set to 1.

The value of SCHDIR should be updated immediately after receiving data, and it depends on the WS signal generated by I2S.

Regardless of the data type and the channel length, the audio data is always received in the form of 16 bits. According to the configured data and the length of the channel, the data needs to be transmitted to the receive buffer once or twice.

Turn off the I2S function, and for different audio protocols, the data length and channel length operation steps are as follows:

The data length is 16 bits, and 32-bit channel length (DATALEN=00, CHLEN=1, I2SSSEL=10) in LSB alignment mode

- Wait until the penultimate RXBNEFLG is set to 1
- Wait for 17 I2S clock cycles (software delay)
- I2SEN=0

The data length is 16 bits, and 32-bit channel length (DATALEN=00, CHLEN=1, I2SSSEL=10) in MSB alignment mode

- Wait until the last RXBNEFLG is set to 1

- Wait for one I2S clock cycle (software delay)
- I2SEN=0

All the other situations

- Wait until the penultimate RXBNEFLG is set to 1
- Wait for one I2S clock cycle (software delay)
- I2SEN=0

BSYFLG flag clock is low during data transmission.

23.5.4.2 I2S slave mode

The configuration method of slave mode is basically the same as that of master mode. In slave mode, the clock signal and WS signal are provided by external I2S device instead of I2S.

Configuration process:

- (1) Configure I2SMOD bit of SPI_I2SCFG register to activate I2S function.
- (2) Configure I2SSSEL bit of SPI_I2SCFG register to select the I2S standard; configure DATALEN[1:0] bit of SPI_I2SCFG register to select the bits of data; configure CHLEN bit of SPI_I2SCFG register to select the data bits per channel; configure I2SMOD bit of SPI_I2SCFG register to select I2S slave mode as transmitting terminal/receiving terminal.
- (3) Configure SPI_CTRL2 register to select to enable the interrupt and DMA function or not (select required or not).
- (4) Set I2SEN bit of SPI_I2SCFG register to 1.

I2S slave mode transmission process

Enable the slave device, write the data to the I2S data register, the external master device will start to communicate, and the external master device will transmit the clock signal, and when the data transmission starts, the transmitting process will begin.

When the first bit data is sent, the 16-bit data will be transferred to the 16-bit shift register in parallel, and then sent out from the pin MOSI/SD in series. When the data is transferred from the data register to the shift register, the TXBEFLG flag bit is set to 1; at this time if TXBEIEN bit of SPI_CTRL2 register is set, an interrupt will be generated. In order to ensure the continuity of data transmission, the next data should be written to SPI_DATA register before the data transmission is completed; otherwise, "underrun" will occur, and the UDRFLG flag bit will be set to 1.

SCHDIR bit of SPI_STS register indicates the channel corresponding to the transmitted data. In the slave mode, the SCHDIR bit is determined by the WS signal of the external master device.

In MSB and LSB alignment mode of I2S, the first data written to the data register corresponds to the data of the left channel.

I2S can be disabled only when TXBEFLG flag bit is set to 1 and BSYFLG flag bit is cleared to 0.

I2S slave mode receiving process

RXBNEFLG bit is used to control the receiving sequence. The RXBNEFLG bit indicates whether the receive buffer is empty; after the receive buffer is full, the RXBNEFLG bit will be set to 1; if RXBNEIEN bit of SPI_CTRL2 register is set, an interrupt will occur, and after the data are read out from SPI_DATA register, RXBNEFLG bit will be cleared to 0; make sure to receive new data after read operation; otherwise, "overrun" will occur, and the OVRFLG flag bit will be set to 1.

The value of SCHDIR should be updated immediately after receiving data, and it depends on the WS signal generated by I2S.

Regardless of the data type and the channel length, the audio data is always received in the form of 16 bits. According to the configured data and the length of the channel, the data needs to be transmitted to the receive buffer once or twice.

To disable I2S, I2SEN flag bit shall be cleared to 0 when receiving the last RXBNEFLG set to 1.

23.5.5 I2S interrupt

23.5.5.1 State flag bit

There are three state flag bits in I2S to monitor the state of I2S bus.

Transmit buffer empty flag bit TXBEFLG

When the TXBEFLG bit is 1, it indicates that the transmit buffer is empty, and the data to be transmitted can be written to the transmit buffer; after data is written, the TXBEFLG bit will be cleared to 0. (When I2S is disabled, the TXBEFLG bit is 0).

Receive buffer non-empty flag bit RXBNEFLG

When the RXBNEFLG flag bit is 1, it indicates that the receive buffer has data to be received; after read operation is performed on the SPI_DATA register, RXBNEFLG flag bit will be cleared to 0.

Busy flag bit BSYFLG

When the BSYFLG bit is 1, it indicates that I2S is in communication state (set and cleared to 0 by hardware), but in the master receiving mode, the BSYFLG flag bit is always 0 during the receiving period.

When I2S is disabled and data transmission is over, the BSYFLG flag bit will be

cleared.

During continuous communication:

- In the master transmitting mode, the BSYFLG flag bit is always high during the transmission period
- In the slave mode, during transmission of each data item, the BSYFLG flag bit is set to 0 within one I2S clock cycle

Channel flag bit SCHDIR

In the transmitting mode, the SCHDIR flag bit indicates the data sent on the SD pin is in the left channel or the right channel. This flag bit is refreshed when TXBEFLG=1.

In the transmitting process of slave mode, if there is an underrun error, the value of SCHDIR flag bit will be invalid. If needing to restart the communication, the I2S function should be turned off and then turned on.

In the receiving mode, the SCHDIR flag bit indicates the received data is from the left channel or the right channel. This flag bit is refreshed when SPI_DATA register receives data.

If there is an underrun error in the receiving mode, the value of SCHDIR flag bit will be invalid. If needing to restart the communication, the I2S function should be turned off and then turned on.

As there is no channel selection in PCM standard, the SCHDIR flg bit is meaningless.

When OVRFLG and UDRFLG flag bits of SPI_STS register is 1 and ERRIEN=1 for SPI_CTRL2, interrupt will be generated. The interrupt flag can be cleared by reading the value of SPI_STS register.

23.5.5.2 Error flag bit

Underrun flag bit UDRFLG

In the transmitting mode, if new data to be transmitted is written to SPI_DATA register before the data is transmitted, UDRFLG bit will be set to 1; at this time if ERRIEN bit of SPI_CTRL2 register is set to 1, an interrupt will be generated.

This flag bit will take effect only after I2SMOD bit of SPI_I2SCFG is set to 1. Clear the UDRFLG bit by reading SPI_STS register.

Overrun flag bit OVRFLG

In the receiving mode, if a new data is received before the data is read, OVRFLG flag bit will be set to 1. At this time if ERRIEN bit of SPI_CTRL2 register is set to 1, an interrupt will be generated, indicating the occurrence of the error.

Read SPI_DATA register to return the last correctly received data, and all the other newly received data will be lost. OVRFLG bit can be cleared by first reading SPI_STS register and then reading SPI_DATA register.

Frame error flag FREFLG

When I2S is configured as slave mode, this flag will be set to 1 by hardware. If the external master arbitrarily changes the WS signal, this flag will be set to 1. When synchronization is lost, to recover from this state and resynchronize the external master with the I2S slave, first disable the I2S, and then re-enable it when the correct level is detected on the WS line.

The loss of synchronization between the master and the slave may be caused by noise interference on the SCK communication clock or WS frame synchronization signal line. If ERRIEN bit is set, an error interrupt may be generated. When reading SPI_STS register, this flag will be cleared to 0 by software.

Table 101 I2S Interrupt Request

Interrupt flag	Interrupt event	Enable control bit	Clearing method
TXBEFLG	Transmit buffer empty flag	TXBEIEN	Write SPI_DATA register
RXBNEFLG	Receive buffer non-empty flag	RXBNEIEN	Read SPI_DATA register
OVRFLG	Underrun flag bit	ERRIEN	Read SPI_STS register
UDRFLG	Overrun flag bit		Read SPI_STS register Read SPI_DATA register again
FREFLG	Frame error flag		Read SPI_STS register

23.5.5.3 DMA function

In I2S mode, the work mode of DMA is the same as that of SPI, except that it does not support CRC function.

23.6 Register address mapping

Table 102 SPI and I2S Register Address Mapping

Register name	Description	Offset address
SPI_CTRL1	SPI control register 1	0x00
SPI_CTRL2	SPI control register 2	0x04
SPI_STS	SPI state register	0x08
SPI_DATA	SPI data register	0x0C
SPI_CRCPOLY	SPI CRC polynomial register	0x10
SPI_RXCRC	SPI receive CRC register	0x14

Register name	Description	Offset address
SPI_TXCRC	SPI transmit CRC register	0x18
SPI_I2SCFG	SPI I2S configuration register	0x1C
SPI_I2SPSC	SPI I2S prescaler register	0x20

23.7 Register functional description

These peripheral registers can be operated by half word (16 bits) or word (32 bits).

23.7.1 SPI control register 1 (SPI_CTRL1) (not used in I2S mode)

Offset address: 0x00

Reset value: 0x0000

Field	Name	R/W	Description
0	CPHA	R/W	<p>Clock Phase Configure</p> <p>This bit indicates on the edge of which clock to start sampling</p> <p>0: On the edge of No. 1 clock</p> <p>1: On the edge of No. 2 clock</p> <p>Note: This bit cannot be modified during communication.</p>
1	CPOL	R/W	<p>Clock Polarity Configure</p> <p>Level state maintained by SCK when SPI is in idle state.</p> <p>0: Low level</p> <p>1: High level</p> <p>Note: This bit cannot be modified during communication</p>
2	MSMCFG	R/W	<p>Master/Salve Mode Configure</p> <p>0: Configure as slave mode</p> <p>1: Configure as master mode</p> <p>Note: This bit cannot be modified during communication</p>
5:3	BRSEL	R/W	<p>Baud Rate Divider Factor Select</p> <p>000: DIV=2</p> <p>001: DIV=4</p> <p>010: DIV=8</p> <p>011: DIV=16</p> <p>100: DIV=32</p> <p>101: DIV=64</p> <p>110: DIV=128</p> <p>111: DIV=256</p> <p>Baud rate=FPCLK/DIV</p> <p>Note: This bit cannot be modified during communication</p>
6	SPIEN	R/W	<p>SPI Device Enable</p> <p>0: Disable</p> <p>1: Enable</p> <p>Note: When SPI device is disabled, please operate according to the process of closing SPI.</p>

Field	Name	R/W	Description
7	LSBSEL	R/W	LSB First Transfer Select 0: First transmit the most significant bit (MSB) 1: First transmit the least significant bit (LSB)
8	ISSEL	R/W	Internal Slave Device Select When CTRL1_SSEN=1 (software NSS mode), select internal NSS level by configuring the bit 0: Internal NSS is low 1: Internal NSS is high
9	SSEN	R/W	Software Slave Device Enable 0: Software NSS mode is disabled, and the internal NSS level is determined by external NSS pin 1: Software NSS mode is enabled, and the internal NSS level is determined by external NSS pin
10	RXOMEN	R/W	Receive Only Mode Enable 0: Transmit and receive at the same time 1: Receive-only mode RXOMEN bit and BMEN bit together determine the transmission direction in the two-line and two-way mode. In the configuration of multiple slave devices, in order to avoid data transmission collision, it is necessary to set RXOMEN bit to 1 on the slave devices that are not accessed.
11	DFLSEL	R/W	Data Frame Length Format Select 0: 8-bit data frame format 1: 16-bit data frame format Only when SPIEN=0, can this bit be written to change the data frame length.
12	CRCNXT	R/W	CRC Transfer Next Enable 0: The next transmitted data is from transmit buffer 1: The next transmitted data is from CRC register Note: After the last data is written to SPI_DATA register, set CRCNXT bit immediately.
13	CRCEN	R/W	CRC Calculate Enable 0: Disable 1: Enable CRC check function only applies to full duplex mode; only when SPIEN=0, can this bit be changed.
14	BMOEN	R/W	Bidirectional Mode Output Enable 0: Disable, namely, receive-only mode 1: Enable, namely, transmit-only mode When BMEN=1, namely, in single-line/double-line mode, this bit decides the transmission direction of transmission line.
15	BMEN	R/W	Bidirectional Mode Enable 0: Double-line unidirectional mode 1: Single-line bidirectional mode Single-line two-way transmission means: the transmission between MOSI pin of data master and MISO pin of slave

23.7.2 SPI control register 2 (SPI_CTRL2)

Offset address: 0x04

Reset value: 0x0000

Field	Name	R/W	Description
0	RXDEN	R/W	Receive Buffer DMA Enable When RXDEN=1, once RXBNEFLG flag is set, DMA request will be issued. 0: Disable 1: Enable
1	TXDEN	R/W	Transmit Buffer DMA Enable When this bit is set, once TXBEFLG flag is set, DMA request will be issued. 0: Disable 1: Enable
2	SSOEN	R/W	SS Output Enable SS output in master mode 0: SS output is disabled, and it can work in multi-master mode. 1: SS output is enabled, and it cannot work in multi-master mode. Note: Not used in I2S mode.
3	Reserved		
4	FRFCFG	R/W	Frame Format Configure 0: SPI Motorola mode 1: SPI TI mode Note: Not available in I2S mode.
5	ERRIEN	R/W	Error interrupt Enable 0: Disable 1: Enable When an error occurs, ERRIEN bit controls whether to generate the interrupt.

24 Controller area network (CAN)

24.1 Full name and abbreviation description of terms

Table 103 Full name and abbreviation description of terms

Full name in English	English abbreviation
First Input First Output	FIFO
Request	REQ

24.2 Introduction

CAN is abbreviation of Controller Area Network, and is serial communication protocol of ISO international standardization and supports CAN Protocol 2.0A and 2.0B. In CAN protocol, the transmitter transmits the message to all receivers in the form of broadcast. When the node receives the message, it will go through the filter group and decide whether the message is needed according to the identifier. This design saves the CPU overhead.

24.3 Main characteristics

- (1) Support CAN protocol 2.0A and 2.0B
- (2) The maximum baud rate of communication is 1Mbit/s
- (3) Transmission function
 - There are three transmitting mailboxes
 - The priority of transmitting message can be configured
 - Record the transmission time
- (4) Receiving function
 - Have two receive FIFO with three depth levels
 - Have 28 filter groups.
 - Record the receiving time

24.4 Functional description

24.4.1 Characteristics of CAN physical layer

There can be multiple communication nodes on the CAN bus, each node consists of a CAN controller and a transceiver. The controller and transceiver are connected through CAN_TX and CAN_RX to transmit logic signals; the transceiver and bus are connected through CAN_High and CAN_Low to transmit differential signals.

24.4.2 Message structure

Figure 102 Standard Data Frame

Figure 103 Extended Data Frame

Note:

- (1) Frame start: used to inform each node that there will be data for transmission.
- (2) Arbitration segment: It is used to decide which message can be transmitted when multiple messages are transmitted. Main content of this segment is ID information, the ID in standard format is 11 bits, and the ID in extended format is 29 bits.
- (3) Control segment: The main content of this segment is data length code (DLC), which is used to indicate how many bytes the data segment has in the message. The data segment has up to 8 bytes.
- (4) Data segment: Include the data information to be sent by the node.
- (5) CRC segment: CRC check code is used to ensure correct transmission of the messages.
- (6) ACK segment: This segment includes ACK slot bit and ACK delimiter bit. The transmitting node in ACK slot transmits recessive bits, while the receiving node transmits the dominant bit in this bit to acknowledge.
- (7) Frame end: Seven recessive bits sent by the transmitting nodes are used to indicate the end.

24.4.3 Working Mode

CAN has three main working modes: initialization mode, normal mode and sleep mode.

24.4.3.1 Initialization mode

Set the INITREQ bit of the configuration register CAN_MCTRL to 1 to request to enter the initialization mode; clear the INITFLG bit to confirm entering the initialization mode.

Clear the INITREQ bit of the configuration register CAN_MCTRL to request to exit the initialization mode; clear the INITFLG bit to confirm exiting the

initialization mode.

Message receiving and transmitting is disabled in initialization mode.

24.4.3.2 Normal mode

Clear the INITREQ bit of the configuration register CAN_MCTRL through software to request to enter the normal mode from the initialization mode; wait for the hardware to clear the INITFLG bit to enter the normal mode.

Message receiving and transmitting is allowed in normal mode.

24.4.3.3 Sleep mode

Set the SLEEPREQ bit of the configuration register CAN_MCTRL to 1 to request to enter the sleep mode.

The clock of CAN stops work in sleep mode, the software can normally access the mailbox register, and the CAN is in low-power state.

24.4.4 Communication mode

There are four communication modes: silent mode, loopback mode, silent loopback mode and normal mode. Different communication modes can be selected only in initialization mode.

24.4.4.1 Silent mode

Set the SILMEN bit of the configuration register CAN_BITTIM to 1 and select the silent mode.

In this mode, only recessive bit (logic 1) can be sent to the bus, while the dominant bit (logic 0) cannot be sent, and the data can be received from the bus.

Figure 104 CAN Works in Silent Mode

24.4.4.2 Loopback mode

Set the LBKMEN bit of the configuration register CAN_BITTIM to 1 and select the loopback mode.

In this mode, the sent data are directly transmitted to the input end for receiving, the data are not received from the bus, and all data can be sent to the bus.

Figure 105 CAN Works in Loopback Mode

24.4.4.3 Loopback silent mode

Set the LBKMEN and SILMEN bits of the configuration register CAN_BITTIM to 1 and select the loopback silent mode.

In this mode, the sent data are directly transmitted to the input end for receiving, and the data are not received from the bus; only recessive bit (logic 1) can be sent to the bus, while the dominant bit (logic 0) cannot be sent.

Figure 106 CAN Works in Silent Loopback Mode

24.4.4.4 Normal mode

In this mode, data can be sent to the bus and be received from the bus.

Figure 107 CAN Works in Normal Mode

24.4.5 Data transmission

24.4.5.1 Conversion of transmitting mailbox state

Conversion process of transmitting mailbox state:

- (1) First select an empty mailbox to set, submit the transmitting request to the CAN bus controller by setting the TXMREQ bit of the configuration register CAN_TXMIDx to 1, and then the mailbox immediately enters the registration state.
- (2) When multiple mailboxes are in the registered state, conduct priority scheduling. When a mailbox has the highest priority, it will enter the predetermined state.
- (3) When the message in the transmitting mailbox is sent to the bus, it will enter the transmitting state.
- (4) After the message is sent successfully, the mailbox will become idle again.

24.4.5.2 Transmitting priority

When multiple messages are waiting for transmitting, determine the transmitting sequence through the TXFPCFG bit of the configuration register CAN_MCTRL:

- When the TXFPCFG bit is set to 0, the priority is determined by the message identifier, the identifier is the lowest, the priority is the highest, the identifier is equal, and the message with small mailbox number will be sent first
- When the TXFPCFG bit is set to 1, the priority will be determined by the sequence of transmitting request

24.4.5.3 Abort

Transmit the abort request by setting the ABREQFLG bit of the configuration register CAN_TXSTS to 1.

If the mailbox is in registered or predetermined state, stop transmitting the request immediately; if the mailbox is in the transmitting state, there are two conditions: one is that the mailbox is successfully sent, the mailbox becomes empty, in such case, the TXSUSFLG bit of the CAN_TXSTS register is set to 1

by hardware; the other is that the mailbox fails to transmit, the mailbox becomes predetermined and the transmitting request is aborted.

24.4.5.4 Automatic retransmission is disabled

Generally, in time triggered communication mode, automatic retransmission should be disabled.

In the mode that the automatic retransmission is disabled, the message is sent only once, and no matter what the result is (success, error or arbitration loss), the hardware will not transmit the message again automatically.

When the transmitting process is finished, set the REQCFLG bit of the CAN_TXSTS register to 1, and the transmitting result will be on the TXSUSFLG, ARBLSTFLG and TXERRFLG bits

24.4.6 Data receiving

24.4.6.1 Receive FIFO

CAN has two receive FIFOs, each FIFO has three mailboxes, the FMNUM[1:0] bit of the register CAN_RXF reflects the number of messages currently stored; set the RFOM bit to 1 to release the output mailbox of receive FIFO; FFULLFLG is the full state flag bit; FOVRFLG is overrun state flag bit.

24.4.6.2 Receive FIFO state conversion

At the beginning FIFO is in empty state, and after receiving the message, it will become registered.

When FIFO is in registered state and three mailboxes are full, after receiving next effective message, it will enter the overrun state, and there are two situations for loss of messages in overrun state:

- If FIFO lock function is disabled, the finally received message will be covered by new message
- If FIFO lock function is enabled, the newly received message will be discarded

24.4.7 Filtering mechanism

Function of the filter: The receiving node decides whether the message is needed according to the message identifier, and only the required message will be received after filtering. CAN controller has 28 filter groups.

24.4.7.1 Bit width

Each group of filters can configure two kinds of bit width.

Figure 108 One 32-bit Filter

ID	CAN_FiBANK1[31:24]				CAN_FiBANK1[23:16]			CAN_FiBANK1[15:8]			CAN_FiBANK1[7:0]		
	STDID[10:3]		STDID[2:0]	EXTID[17:13]		EXTID[12:5]			EXTID[4:0]	IDTYP ESEL	TXRFR EQ	0	

Figure 109 Two 16-bit Filters

ID	CAN_FiBANK1[15:8]				CAN_FiBANK1[7:0]			CAN_FiBANK2[15:8]			CAN_FiBANK2[7:0]		
	STDID[10:3]		STDID [2:0]	TXRF REQ	IDTYP ESEL	EXTID [17:15]		STDID[12:5]			STDID [2:0]	TXRF REQ	IDTYP ESEL

24.4.7.2 Filtering mode

Mask bit mode

In this mode, it is only required to use some bits of the message identifier as a list to form the mask, and the message ID should be the same as the mask, and then the message can be received

Table 104 Mask Bit Mode Example

ID	1	0	1	1	0	0	1	0
Mask	1	0	1	1	1	0	0	1
Screened ID	1	X	1	1	0	X	X	0

Identifier list mode

In this mode, each bit of the message ID needs to be the same as the filter identifier, and then the message can be received.

Table 105 Identifier List Mode Example

ID	1	1	1	0	1	0	0	1	1
ID	1	1	1	0	1	0	0	1	1
Screened ID	1	1	1	0	1	0	0	1	1

24.4.7.3 Filter priority

The priority rules are as follows:

- The priority of the filter with bid width of 32 bits is higher than that with bid width of 16 bits
- Under the condition of the same bit width, the priority of the identifier list mode is higher than that of mask bit mode
- Under the condition of the same bit width and mode, the priority of the small filtering number is high

24.4.8 Bit timing and baud rate

24.4.8.1 Bit timing

The CAN peripheral bit timing of APM32 contains three segments: synchronization segment (SYNC_SEG), time segment 1 (BS1) and time segment 2 (BS2), and the sampling points are at the junction of BS1 and BS2 segments.

- Synchronization segment (SYNC_SEG): This bit occupies one time cell
- Time segment 1 (BS1): This segment occupies one to 16 time cells, and it contains PROP_SEG and PHASE_SEG1 in CAN standard
- Time segment 2 (BS2): This segment occupies one to eight time cells, and it represents PHASE_SEG2 in CAN standard

24.4.8.2 Calculation of baud rate

Time of BS1 segment: $T_{s1} = T_q * (TIMSEG1[3:0] + 1)$

Time of BS2 segment: $T_{s2} = T_q * (TIMSEG2[2:0] + 1)$

Time of one data bit: $T_{1bit} = 1T_q + T_{s1} + T_{s2}$

Baud rate = $1 / T_{1bit}$

$T_q = (BRPSC + 1) * TPCLK$

24.4.9 Error management

Transmit the error counter through the TXERRCNT bit of the configuration register CAN_ERRSTS and receive the error counter through the RXERRCNT bit of the register CAN_ERRSTS to reflect the error management of CAN bus.

Control the generation of interrupt in error state through the ERRIEN bit of the configuration register CAN_INTEN.

24.4.9.1 Bus-line recovery

When the TXERRCNT of the CAN error state register is greater than 255, the CAN bus controller will enter the bus-line state, then the BOFLG bit of the register CAN_ERRSTS is set to 1, and in this state, the CAN bus controller cannot receive and transmit messages.

Decide the bus-line recovery mode through the ALBOFFM bit of the configuration register CAN_MCTRL:

- If the ALBOFFM bit is set to 1, once the hardware detects 11 continuous recessive bits for 128 times, it will exit the bus-line state automatically;
- If the ALBOFFM bit is set to 0, after the software requests to enter and then exit the initialization mode, it will exit the bus-line state.

24.4.10 Interrupt

Events generating transmitting interrupt:

- The hardware sets REQCFLG0 bit of the register CAN_TXSTS to 1, and the transmitting mailbox 0 becomes idle
- The hardware sets REQCFLG1 bit of the register CAN_TXSTS to 1, and the transmitting mailbox 1 becomes idle
- The hardware sets REQCFLG2 bit of the register CAN_TXSTS to 1, and the transmitting mailbox 2 becomes idle

Events generating FIFO0 interrupt:

- Set the FMNUM0[1:0] bit of the register CAN_RXF0 to a number rather than 0 by the hardware, and FIFO0 will receive a new message
- Set the FFULLFLG0 bit of the register CAN_RXF0 to 1 by the hardware, and FIFO0 will be full
- Set the FOVRFLG0 bit of the register CAN_RXF0 to 1 by the hardware and FIFO0 will overrun

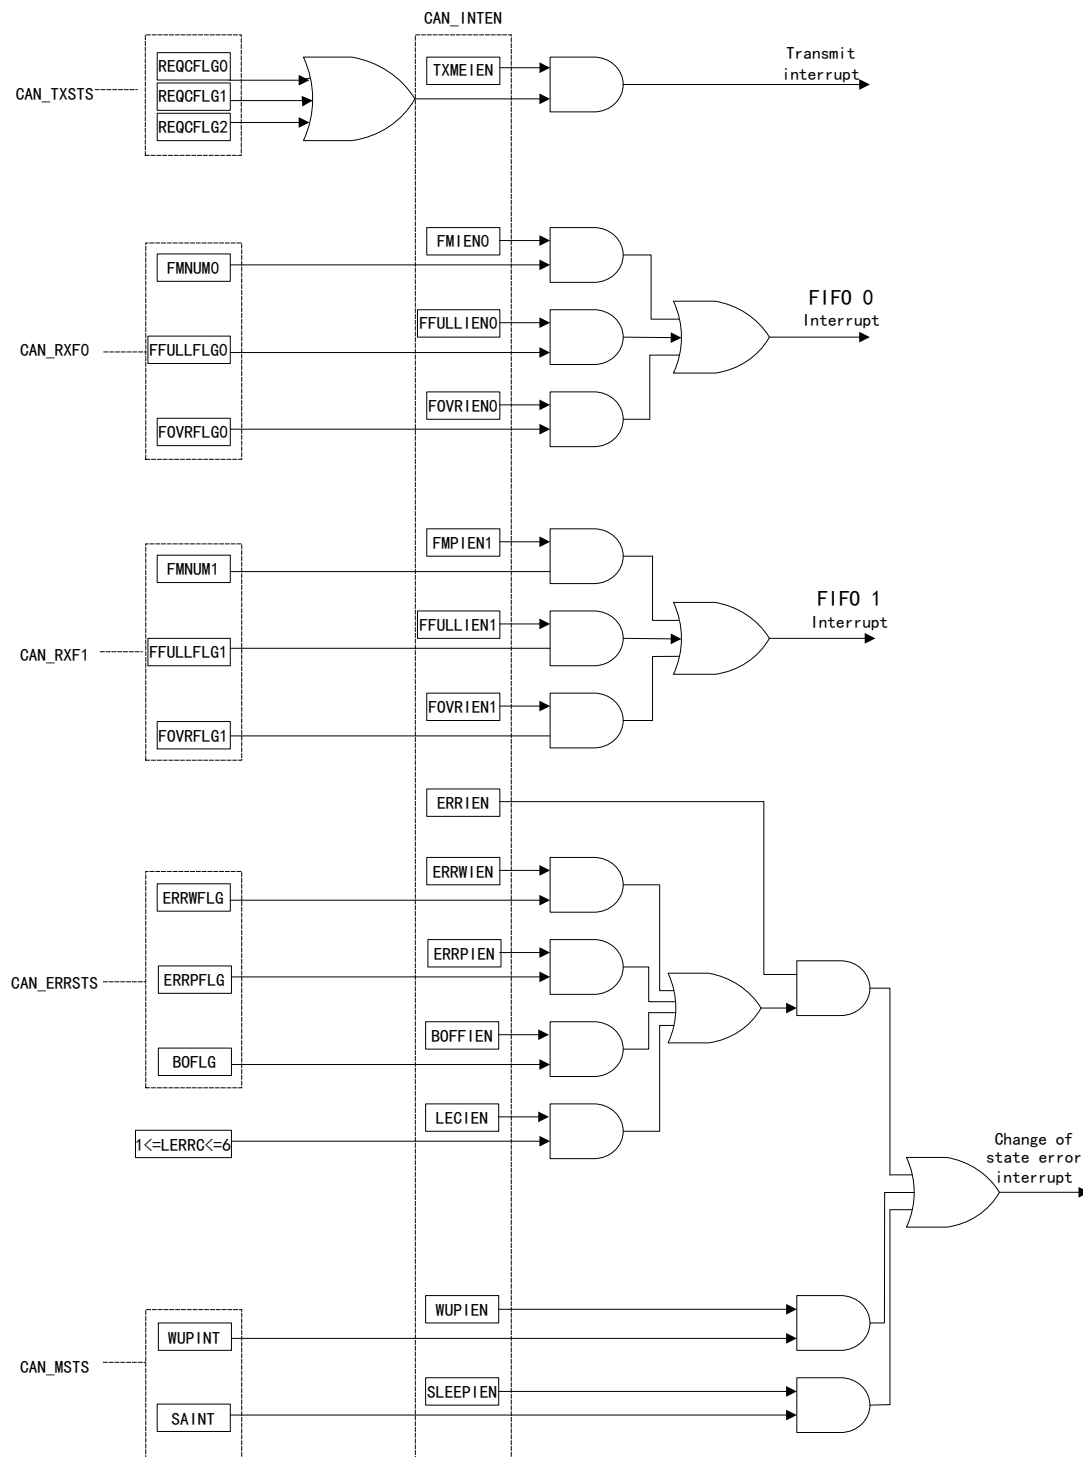

Events generating FIFO1 interrupt:

- Set the FMNUM1[1:0] bit of the register CAN_RXF1 to a number rather than 0 by the hardware, and FIFO1 will receive a new message
- Set the FFULLFLG1 bit of the register CAN_RXF1 to 1 by the hardware, and FIFO1 will be full
- Set the FOVRFLG1 bit of the register CAN_RXF1 to 1 by the hardware and FIFO1 will overrun

Events generating state change and error interrupt:

- Set the SLEEPIEN bit of the register CAN_INTEN to 1 by the hardware and it will enter the sleep mode
- Set the WUPIEN bit of the register CAN_INTEN to 1 by the hardware and interrupt enable will be woken up
- Set the ERRWFLG bit of the register CAN_ERRSTS to 1 by the hardware, and it means that the number of errors has reached the threshold
- Set the ERRPFLG bit of the register CAN_ERRSTS to 1 by the hardware, and it means that the number of errors has reached the threshold of passive error
- Set the LERRC[2:0] bit of the register CAN_ERRSTS by the hardware, and it indicates the condition of last error

Figure 110 Event Flag and Interrupt Generation

24.5 Register address mapping

CAN1 base address: 0x4000_6400

CAN2 base address: 0x4000_6800

Note: Except base address, the register and offset addresses of CAN1 and CAN2 are exactly the same.

Table 106 CAN Register Address Mapping

Register name	Description	Offset address
CAN_MCTRL	CAN main control register	0x00
CAN_MSTS	CAN main state register	0x04
CAN_TXSTS	CAN transmit state register	0x08
CAN_RXF0	CAN receive FIFO 0 register	0x0C
CAN_RXF1	CAN receive FIFO 1 register	0x10
CAN_INTEN	CAN interrupt enable register	0x14
CAN_ERRSTS	CAN error state register	0x18
CAN_BITTIM	CAN bit timing register	0x1C
CAN_TXMIDx	Transmitting mailbox identifier register	0x180, 0x190, 0x1A0
CAN_TXDLENx	Transmitting mailbox data length register	0x184, 0x194, 0x1A4
CAN_TXMDLx	Transmitting mailbox low-byte data register	0x188, 0x198, 0x1A8

Reset value: 0x1C00 0000

Field	Name	R/W	Description
0	REQCFLG0	RC_W1	<p>Mailbox 0 Request Completed Flag</p> <p>When the last transmission or abortion request of the mailbox 0 is completed, this bit is set to 1 by hardware; when receiving the transmission request, this bit is cleared by hardware; it is written to 1 or cleared by software.</p> <p>0: Being transmitted 1: Transmission completed</p>
1	TXSUSFLG0	RC_W1	<p>Mailbox 0 Transmission Success Flag</p> <p>When mailbox 0 attempts to transmit successfully, this bit is set to 1 by hardware; and written to 1 and cleared by software.</p> <p>0: Last transmission attempt failed 1: Last transmission attempt succeeded</p>
2	ARBLSTFLG0	RC_W1	<p>Mailbox 0 Arbitration Lost Flag</p> <p>When the mailbox 0 loses arbitration, this bit is set to 1 by hardware; and written to 1 and cleared by software.</p> <p>0: Meaningless 1: Lost</p>
3	TXERRFLG0	RC_W1	<p>Mailbox 0 Transmission Error Flag</p> <p>When mailbox 0 fails to transmit, this bit is set to 1 by hardware; and written to 1 and cleared by software.</p> <p>0: Meaningless 1: Failed to transmit</p>
6:4	Reserved		
7	ABREQFLG0	R/S	<p>Mailbox 0 Abort Request Flag</p> <p>If there is no message waiting for Transmitting in mailbox 0, this bit is ineffective.</p> <p>0: The transmitting message of mailbox 0 is cleared, and this bit is cleared by hardware 1: Set this bit to 1 to abort the transmission request of mailbox 0</p>
8	REQCFLG1	RC_W1	<p>Mailbox 1 Request Completed Flag</p> <p>When the last request of mailbox 1 is sent or aborted, this bit is set to 1 by hardware; When receiving the transmission request, this bit is cleared by hardware, and written to 1 and cleared by software.</p> <p>0: Being transmitted 1: Transmission completed</p>
9	TXSUSFLG1	RC_W1	<p>Mailbox 1 Transmission Success Flag</p> <p>When mailbox 1 attempts to transmit successfully, this bit is set to 1 by hardware; and written to 1 and cleared by software.</p> <p>0: Last transmission attempt failed 1: Last transmission attempt succeeded</p>
10	ARBLSTFLG1	RC_W1	<p>Mailbox 1 Arbitration Lost Flag</p> <p>When the mailbox 1 loses arbitration, this bit is set to 1 by hardware; and written to 1 and cleared by software.</p> <p>0: Meaningless 1: Lost</p>

Field	Name	R/W	Description
11	TXERRFLG1	RC_W1	Mailbox 1 Transmission Error Flag When mailbox 1 fails to transmit, this bit is set to 1 by hardware; and written to 1 and cleared by software. 0: Meaningless 1: Failed to transmit
14:12	Reserved		
15	ABREQFLG1	R/S	Mailbox 1 Abort Request Flag If there is no message waiting for transmitting in mailbox 1, this bit is ineffective. 0: The transmitting message of mailbox 1 is cleared, and this bit is cleared by hardware 1: Set this bit to 1 to abort the transmission request of mailbox 1
16	REQCFLG2	RC_W1	Mailbox 2 Request Completed Flag When the last transmission or abortion request of the mailbox 2 is completed, this bit is set to 1 by hardware; when receiving the transmission request, this bit is cleared by hardware; it is written to 1 or cleared by software. 0: Being transmitted 1: Transmission completed
17	TXSUSFLG2	RC_W1	Mailbox 2 Transmission Success Flag When mailbox 2 attempts to transmit successfully, this bit is set to 1 by hardware; and written to 1 and cleared by software. 0: Last transmission attempt failed 1: Last transmission attempt succeeded
18	ARBLSTFLG2	RC_W1	Mailbox 2 Arbitration Lost Flag When the mailbox 2 loses arbitration, this bit is set to 1 by hardware; and written to 1 and cleared by software. 0: Meaningless 1: Lost
19	TXERRFLG2	RC_W1	Mailbox 2 Transmission Error Flag When mailbox 2 fails to transmit, this bit is set to 1 by hardware; and written to 1 and cleared by software. 0: Meaningless 1: Failed to transmit
22:20	Reserved		
23	ABREQFLG2	R/S	Mailbox 2 Abort Request Flag If there is no message waiting for transmitting in mailbox 2, this bit is ineffective. 0: The transmitting message of mailbox 2 is cleared, and this bit is cleared by hardware 1: Set this bit to 1 to abort the transmission request of mailbox 2
25:24	EMNUM[1:0]	R	Empty Mailbox Number This bit is applicable when there is empty mailbox. When all the Transmitting mailboxes are empty, it means the number of the transmitting mailbox with the lowest priority; when the mailbox is not empty but not all empty, it means the number of next mailbox to be sent.

Field	Name	R/W	Description
26	TXMEFLG0	R	Transmit Mailbox 0 Empty Flag When the Transmitting mailbox 0 is empty, this bit is set to 1 by hardware. 0: There is message to be sent in mailbox 0 1: There is no message to be sent in mailbox 0
27	TXMEFLG1	R	Transmit Mailbox 1 Empty Flag When the Transmitting mailbox 1 is empty, this bit is set to 1 by hardware. 0: There is message to be sent in mailbox 1 1: There is no message to be sent in mailbox 1
28	TXMEFLG2	R	Transmit Mailbox 2 Empty Flag When the transmitting mailbox 2 is empty, this bit is set to 1 by hardware. 0: There is message to be sent in mailbox 2 1: There is no message to be sent in mailbox 2
29	LOWESTP0	R	The Lowest Transmission Priority Flag For Mailbox 0 0: Meaningless 1: The priority of mailbox 0 is the lowest among those mailboxes waiting to transmit messages Note: If there is only one mailbox waiting, LOWESTP[2:0] is cleared.
30	LOWESTP1	R	The Lowest Transmission Priority Flag For Mailbox 1 0: Meaningless 1: The priority of mailbox 1 is the lowest among those mailboxes waiting to transmit messages
31	LOWESTP2	R	The Lowest Transmission Priority Flag For Mailbox 2 0: Meaningless 1: The priority of mailbox 2 is the lowest among those mailboxes waiting to transmit messages

24.6.1.4 CAN receive FIFO 0 register (CAN_RXF0)

Offset address: 0x0C

Reset value: 0x00

Field	Name	R/W	Description
1:0	FMNUM0[1:0]	R	The number of Message in receive FIFO0 These bits are used to reflect the number of messages stored in current receive FIFO0. Every time a new message is received, add 1 to FMNUM0 bit; every time the mailbox message is released and outputted, subtract 1 from FMNUM0 bit.
2	Reserved		
3	FFULLFLG0	RC_W1	Receive FIFO0 Full Flag When there are three messages in FIFO0, it means the FIFO0 has been full; this bit is set to 1 by hardware and written to 1 and cleared by software. 0: Not full 1: Full

Field	Name	R/W	Description
4	FOVRFLG0	RC_W1	Receive FIFO 0 Overrun Flag When there are three messages in FIFO0 and then a new message is received, it means the FIFO0 overrun; this bit is set to 1 by hardware and written to 1 and cleared by software. 0: No overrun 1: Overrun is generated
5	RFOM0	R/S	Release Receive FIFO0 Output Mailbox to Receive Message This bit is set to 1 by hardware and cleared by software. If there is no message in FIFO, this bit is invalid. When FIFO contains more than two messages, the output mailbox must be first released to access the second message. 0: Meaningless 1: Release the output mailbox of receive FIFO0
31:6	Reserved		

24.6.1.5 CAN receive FIFO 1 register (CAN_RXF1)

Offset address: 0x10

Reset value: 0x00

Field	Name	R/W	Description
1:0	FMNUM1[1:0]	R	The number of Message in receive FIFO1 These bits are used to reflect the number of messages stored in current receive FIFO1. Every time a new message is received, add 1 to FMNUM1 bit; every time the mailbox message is released and outputted, subtract 1 from FMNUM1 bit.
2	Reserved		
3	FFULLFLG1	RC_W1	Receive FIFO0 Full Flag When there are three messages in FIFO1, it means the FIFO1 has been full; this bit is set to 1 by hardware and written to 1 and cleared by software. 0: Not full 1: Full
4	FOVRFLG1	RC_W1	Receive FIFO1 Overrun Flag When there are three messages in FIFO1 and then a new message is received, it means the FIFO1 overrun ; this bit is set to 1 by hardware and written to 1 and cleared by software. 0: No overrun 1: Overrun is generated
5	RFOM1	R/S	Release Receive FIFO1 Output Mailbox to Receive Message This bit is set to 1 by hardware and cleared by software. If there is no message in FIFO, this bit is invalid. When FIFO contains more than two messages, the output mailbox must be first released to access the second message. 0: Meaningless 1: Release the output mailbox of receive FIFO1
31:6	Reserved		

24.6.1.6 CAN interrupt enable register (CAN_INTEN)

Offset address: 0x14

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TXMEIEN	R/W	<p>Transmit Mailbox Empty Interrupt Enable</p> <p>When REQCFGx bit is set to 1, it means transmission has been completed, and the transmitting mailbox is empty; if this bit is set to 1, an interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
1	FMIEN0	R/W	<p>Interrupt Enable When The Number Of FIFO0 Message Is Not 0</p> <p>When FMNUM0[1:0] bit of FIFO 0 is not zero, it means that the number of messages in FIFO0 is not zero; if this bit is set to 1, an interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
2	FFULLIEN0	R/W	<p>FIFO0 Full Interrupt Enable</p> <p>When the FFULLFLG0 bit of FIFO0 is set to 1, it means that the message of FIFO0 is full; if this bit is set to 1, an interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
3	FOVRIEN0	R/W	<p>FIFO0 Overrun Interrupt Enable</p> <p>When the FOVRFLG0 bit of FIFO0 is set to 1, it means that the FIFO0 has been overloaded; if this bit is set to 1, an interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
4	FMPIEN1	R/W	<p>Interrupt Enable when the number of FIFO1 Message is not 0</p> <p>When FMNUM1[1:0] bit of FIFO 1 is not zero, it means that the number of messages in FIFO1 is not zero; if this bit is set to 1, an interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
5	FFULLIEN1	R/W	<p>FIFO1 Full Interrupt Enable</p> <p>When the FFULLFLG1 bit of FIFO1 is set to 1, it means that the message of FIFO1 is full; if this bit is set to 1, an interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
6	FOVRIEN1	R/W	<p>FIFO1 Overrun Interrupt Enable</p> <p>When the FOVRFLG1 bit of FIFO1 is set to 1, it means that the FIFO1 has been overloaded; if this bit is set to 1, an interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
7	Reserved		

Field	Name	R/W	Description
8	ERRWIEN	R/W	<p>Error Warning Interrupt Enable</p> <p>When ERRWFLG bit is set to 1, an error warning will occur; if this bit is set to 1, ERRIFLG shall be set and a warning error interrupt will be generated.</p> <p>0: ERRIFLG bit is not set 1: ERRIFLG bit is set to 1</p>
9	ERRPIEN	R/W	<p>Error Passive Interrupt Enable</p> <p>When ERRPFLG bit is set to 1, a pssive error will occur; if this bit is set to 1, ERRIFLG shall be set and a passive error interrupt will be generated.</p> <p>0: ERRIFLG bit is not set 1: ERRIFLG bit is set to 1</p>
10	BOFFIEN	R/W	<p>Bus-Off Interrupt Enable</p> <p>When BOFFFLG bit is set to 1, bus-line will occur; if this bit is set to 1, ERRIFLG shall be set and an bus-line error interrupt will be generated.</p> <p>0: ERRIFLG bit is not set 1: ERRIFLG bit is set to 1</p>
11	LECIEN	R/W	<p>Last Error Code Interrupt Enable</p> <p>When an error is detected and the hardware sets LERRC [2:0], the last error code is recorded. If this bit set to 1, the ERRIFLG is set to generate the last error interrupt.</p> <p>0: ERRIFLG bit is not set 1: ERRIFLG bit is set to 1</p>
14:12	Reserved		
15	ERRIEN	R/W	<p>Error interrupt Enable</p> <p>When the corresponding error state register is set to 1, if this bit is set to 1, an error interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
16	WUPIEN	R/W	<p>Wakeup Interrupt Enable</p> <p>When WUPINT bit is set to 1, if this bit is set to 1, a wake-up interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
17	SLEEPIEN	R/W	<p>Sleep Interrupt Enable</p> <p>When SLEEPIFLG bit is set to 1, if this bit is set to 1, a sleep interrupt will be generated.</p> <p>0: No interrupt 1: Interrupt generated</p>
31:18	Reserved		

24.6.1.7 CAN error state register (CAN_ERRSTS)

Offset address: 0x18

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	ERRWFLG	R	Error Warning Occur Flag When the value of the receiving error counter or transmitting error counter ≥ 96 , this bit is set to 1 by hardware. 0: No error warning 1: Error warning occurred
1	ERRPFLG	R	Error Passive Occur Flag When the value of the receiving error counter or transmitting error counter ≥ 127 , this bit is set to 1 by hardware. 0: No passive error 1: Passive error occurred
2	BOFLG	R	Enter Bus-Off Flag When the value of the transmitting error counter TXERRCNT is greater than 255, CAN will enter the bus-line state and this bit is set to 1 by hardware. 0: CAN not in bus-line state 1: CAN in bus-line state
3	Reserved		
6:4	LERRC	R/W	Record Last Error Code When the error on CAN bus is detected, it is set by hardware according to the error category; when the message is sent or received correctly, this bit is cleared by hardware. 000: No error 001: Bit stuffing error 010: Form (Form) error 011: Acknowledgment (ACK) error 100: Recessive bit error 101: Dominant bit error 110: CRC error 111: Set by software
15:7	Reserved		
23:16	TXERRCNT	R	Least Significant Byte Of The 9-Bit Transmit Error Counter The counter is implemented according to the transmission part of fault definition mechanism of CAN protocol.
31:24	RXERRCNT	R	Receive Error Counter The receiving error counter is implemented according to the receiving part of fault definition mechanism of CAN protocol. When receiving error occurs, according to the condition of error, add 1 or 8 to the counter, and subtract 1 after receiving successfully. When the value of the counter is greater than 127, set the counter value to 120.

24.6.1.8 CAN bit timing register (CAN_BITTIM)

Offset address: 0x1C

Reset value: 0x0123 0000

Field	Name	R/W	Description
9:0	BRPSC	R/W	Baud Rate Prescaler Factor Setup Time cell $t_q = (BRPSC + 1) \times t_{PCLK}$

Field	Name	R/W	Description
15:10	Reserved		
19:16	TIMSEG1	R/W	Set the time segment 1 (Time Segment 1 Setup) Time occupied by time period 1 $tBS1 = tCAN \times (TIMSEG1+1)$.
22:20	TIMSEG2	R/W	Set the time segment 2 (Time Segment 2 Setup) Time occupied by time period 2 $tBS2 = tCAN \times (TIMSEG2+1)$.
23	Reserved		
25:24	RSYNJW	R/W	Resynchronization Jump Width Time that CAN hardware can extend or shorten in this bit $tRJW=tCAN \times (RSYNJW+1)$.
29:26	Reserved		
30	LBKMEN	R/W	Loop Back Mode Enable 0: Disable 1: Enable
31	SILMEN	R/W	Silent Mode Enable 0: Normal state 1: Silent mode

Note: When CAN is in initialization mode, this register can be accessed only by software

24.6.2 CAN mailbox register

This section describes the transmitting and receiving mailbox registers.

The transmitting and receiving mailboxes are almost the same except the following examples:

- FMIDX domain of CAN_RXDLENx register;
- The receiving mailbox is read-only;
- The transmitting mailbox is writable only when it is empty, and if the corresponding TXMEFLG bit of CAN_TXSTS register is 1, it means the transmitting mailbox is empty.

There are three transmitting mailboxes and two receiving mailboxes in total.

Each receiving mailbox is FIFO with three levels of depth, and can only access the message that is received first in FIFO.

24.6.2.1 Transmitting mailbox identifier register (CAN_TXMIDx) (x=0..2)

Offset address: 0x180, 0x190, 0x1A0

Reset value: 0xXXXX XXXX, X=undefined bit (except Bit 0, TXMREQ=0 after reset)

Field	Name	R/W	Description
0	TXMREQ	R/W	Transmit Mailbox Data Request 0: When the data in the mailbox is sent, the mailbox is empty and this bit is cleared by hardware 1: Software writes 1, to enable request to transmit mailbox data
1	TXRFREQ	R/W	Transmit Remote Frame Request 0: Data frame 1: Remote frame

Field	Name	R/W	Description
2	IDTYPESEL	R/W	Identifier Type Select 0: Standard identifier 1: Extended identifier
20:3	EXTID[17:0]	R/W	Extended Identifier Setup Low byte of extended identity label.
31:21	STDID[10:0]/EXTID[28:18]	R/W	Standard Identifier Or Extended Identifier According to the content of IDTYPESEL bit, these bits are standard identifier STDID [10:0] and high byte EXTID[28:18] of extended identifier.

Note: 1. When its mailbox is in the state of waiting for transmission, this register is write-protected

2. This register realizes transmission request control function (No. 0 bit) - the reset value is 0

24.6.2.2 Transmitting mailbox data length register (CAN_TXDLENx) (x=0..2)

When the mailbox is not idle, all bits of this register are write-protected.

Offset address: 0x184, 0x194, 0x1A4

Reset value: 0xXXXX XXXX

Field	Name	R/W	Description
3:0	DLCODE	R/W	Transmit Data Length Code Setup
31:4	Reserved		

24.6.2.3 Transmitting mailbox low-byte data register (CAN_TXMDLx) (x=0..2)

When the mailbox is not idle, all bits of this register are write-protected, and the message contains 0 to 7-byte data and starts from the byte 0.

Offset address: 0x188, 0x198, 0x1A8

Reset value: 0xXXXX XXXX

Field	Name	R/W	Description
7:0	DATABYTE0	R/W	Data Byte 0 of the Message
15:8	DATABYTE1	R/W	Data Byte 1 of the Message
23:16	DATABYTE2	R/W	Data Byte 2 of the Message
31:24	DATABYTE3	R/W	Data Byte 3 of the Message

24.6.2.4 Transmitting mailbox high-byte data register (CAN_TXMDHx) (x=0..2)

When the mailbox is not idle, all bits of this register are write-protected.

Offset address: 0x18C, 0x19C, 0x1AC

Reset value: 0xXXXX XXXX, X=undefined bit

Field	Name	R/W	Description
7:0	DATABYTE4	R/W	Data Byte 4 of the Message
15:8	DATABYTE5	R/W	Data Byte 5 of the Message
23:16	DATABYTE6	R/W	Data Byte 6 of the Message
31:24	DATABYTE7	R/W	Data Byte 7 of the Message

24.6.2.5 Receive FIFO mailbox identifier register (CAN_RXMIDx) (x=0..1)

Offset address: 0x1B0, 0x1C0

Reset value: 0xXXXX XXXX, X=undefined bit

Field	Name	R/W	Description
0	Reserved		
1	RFTXREQ	R	Remote Frame Transmission Request 0: Data frame 1: Remote frame
2	IDTYPESEL	R	Identifier Type Select 0: Standard identifier 1: Extended identifier
20:3	EXTID[17:0]	R	Extended Identifier Setup Low byte of extended identifier.
31:21	STDID[10:0]/EXTID[28:18]	R	Standard Identifier Or Extended Identifier According to the content of IDTYPESEL bit, these bits are standard identifier STDI [10:0] and high byte EXTID [28:18] of extended identifier.

Note: All receiving mailbox registers are read-only.

24.6.2.6 Receive FIFO mailbox data length register (CAN_RXDLENx) (x=0..1)

Offset address: 0x1B4, 0x1C4

Reset value: 0xXXXXXX XXXX

Field	Name	R/W	Description
3:0	DLCODE	R	Receive Data Length Code Setup This bit represents the data length in the frame; for remote frame, DLCODE is constantly 0.
7:4	Reserved		
15:8	FMIDX	R	Filter Match Index Setup
31:16	Reserved		

Note: All receiving mailbox registers are read-only.

24.6.2.7 Receive FIFO mailbox low-byte data register (CAN_RXMDLx) (x=0..1)

Offset address: 0x1B8, 0x1C8; the message contains 0 to 8-byte data, which starts from the byte 0.

Reset value: 0xXXXXXX XXXX

Field	Name	R/W	Description
7:0	DATABYTE0	R	Data Byte 0 of the Message
15:8	DATABYTE1	R	Data Byte 1 of the Message
23:16	DATABYTE2	R	Data Byte 2 of the Message
31:24	DATABYTE3	R	Data Byte 3 of the Message

Note: All receiving mailbox registers are read-only.

24.6.2.8 Receive FIFO mailbox high-byte data register (CAN_RXMDHx) (x=0..1)

Offset address: 0x1BC, 0x1CC

Reset value: 0xXXXX XXXX, X=undefined bit

Field	Name	R/W	Description
7:0	DATABYTE4	R	Data Byte 4 of the Message
15:8	DATABYTE5	R	Data Byte 5 of the Message
23:16	DATABYTE6	R	Data byte 6 of the Message
31:24	DATABYTE7	R	Data byte 7 of the Message

Note: All receiving mailbox registers are read-only.

24.6.3 CAN filter register

24.6.3.1 CAN filter control register (CAN_FCTRL)

Offset address: 0x200

Reset value: 0x2A1C 0E01

Field	Name	R/W	Description
0	FINITEN	R/W	Filter Init Mode Enable 0: Normal mode 1: Initialization mode
7:1	Reserved		
13:8	CAN2SB	R/W	CAN2 Start Bank They define the start bank for the CAN2 interface (Slave) in the range 0 to 27. Note: When CAN2SB[5:0] = 28d, all the filters to CAN1 can be used. When CAN2SB[5:0] is set to 0, all the filters to CAN2 can be used.
31:14	Reserved		

Note: The non-reserved bit of this register is completely controlled by software.

24.6.3.2 CAN filter mode configuration register (CAN_FCFG)

Offset address: 0x204

Reset value: 0x0000 0000

Field	Name	R/W	Description
27:0	FMCFGx	R/W	Filter Mode Configure The value of x is within 0-27. 0: Identifier mask bit mode 1: Identifier list mode
31:28	Reserved		

Note: Only when CAN_FCTRL (FINITEN =1) is set to make the filter in initialization mode, can this register be written.

24.6.3.3 CAN filter bit width configuration register (CAN_FSCFG)

Offset address: 0x20C

Reset value: 0x0000 0000

Field	Name	R/W	Description
27:0	FSCFGx	R/W	Filterx Scale Configure The value of x is within 0-27. 0: Two 16 bits 1: Single 32 bits
31:28	Reserved		

Note: Only when CAN_FCTRL (FINITEN =1) is set to make the filter in initialization mode, can this register be written.

24.6.3.4 CAN filter FIFO association register (CAN_FFASS)

Offset address: 0x214

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	FFASS0	R/W	Configure Filter0 Associated with FIFO 0: The filter is associated with FIFO0 1: The filter is associated with FIFO1
1	FFASS1	R/W	Configure Filter1 Associated with FIFO Refer to FFASS0 for specific description.
2	FFASS2	R/W	Configure Filter2 Associated with FIFO Refer to FFASS0 for specific description.
3	FFASS3	R/W	Configure Filter3 Associated with FIFO Refer to FFASS0 for specific description.
4	FFASS4	R/W	Configure Filter4 Associated with FIFO Refer to FFASS0 for specific description.
5	FFASS5	R/W	Configure Filter5 Associated with FIFO Refer to FFASS0 for specific description.
6	FFASS6	R/W	Configure Filter6 Associated with FIFO Refer to FFASS0 for specific description.
7	FFASS7	R/W	Configure Filter7 Associated with FIFO Refer to FFASS0 for specific description.
8	FFASS8	R/W	Configure the filter 8 associated with FIFO (Configure Filter8 Associated with FIFO) Refer to FFASS0 for specific description.
9	FFASS9	R/W	Configure Filter9 Associated with FIFO Refer to FFASS0 for specific description.
10	FFASS10	R/W	Configure Filter10 Associated with FIFO Refer to FFASS0 for specific description.
11	FFASS11	R/W	Configure Filter11 Associated with FIFO Refer to FFASS0 for specific description.
12	FFASS12	R/W	Configure Filter12 Associated with FIFO Refer to FFASS0 for specific description.
13	FFASS13	R/W	Configure Filter13 Associated with FIFO Refer to FFASS0 for specific description.
14	FFASS14	R/W	Configure Filter14 Associated with FIFO Refer to FFASS0 for specific description.

Field	Name	R/W	Description
15	FFASS15	R/W	Configure Filter15 Associated with FIFO Refer to FFASS0 for specific description.
16	FFASS16	R/W	Configure Filter16 Associated with FIFO Refer to FFASS0 for specific description.
17	FFASS17	R/W	Configure Filter17 Associated with FIFO Refer to FFASS0 for specific description.
18	FFASS18	R/W	Configure Filter18 Associated with FIFO Refer to FFASS0 for specific description.
19	FFASS19	R/W	Configure Filter19 Associated with FIFO Refer to FFASS0 for specific description.
20	FFASS20	R/W	Configure Filter20 Associated with FIFO Refer to FFASS0 for specific description.
21	FFASS21	R/W	Configure Filter21 Associated with FIFO Refer to FFASS0 for specific description.
22	FFASS22	R/W	Configure Filter22 Associated with FIFO Refer to FFASS0 for specific description.
23	FFASS23	R/W	Configure Filter23 Associated with FIFO Refer to FFASS0 for specific description.
24	FFASS24	R/W	Configure Filter24 Associated with FIFO Refer to FFASS0 for specific description.
25	FFASS25	R/W	Configure Filter25 Associated with FIFO Refer to FFASS0 for specific description.
26	FFASS26	R/W	Configure Filter26 Associated with FIFO Refer to FFASS0 for specific description.
27	FFASS27	R/W	Configure Filter27 Associated with FIFO Refer to FFASS0 for specific description.
31:28	Reserved		

Note: Only when CAN_FCTRL (FINITEN =1) is set to make the filter in initialization mode, can this register be written.

24.6.3.5 CAN filter activation register (CAN_FACT)

Offset address: 0x21C

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	FACT0	R/W	Filter0 Active 0: Disable 1: Active
1	FACT1	R/W	Filter1 Active Refer to FACT0 for specific description.
2	FACT2	R/W	Filter2 Active Refer to FACT0 for specific description.

24.6.3.6 Register x of CAN filter group i (CAN_FiBANKx) (i=0..27; x=1..2)

Offset address: 0x240..0x31C

CAN_F0BANK1 offset address: 0x240 CAN_F0BANK2 offset address: 0x244

CAN_F1BANK1 offset address: 0x248 CAN_F1BANK2 offset address:
0x24C

The following offset addresses can be obtained in the same way

Reset value: 0xXXXX XXXX

Field	Name	R/W	Description
31:0	FBIT[31:0]	R/W	Filter Bits Setup Identifier list mode: 0: FBITx bit is dominant bit 1: FBITx bit is recessive bit Identifier mask bit mode: 0: FBITx is not used for comparison 1: FBITx must match Note: The value of x is 0~31, indicating the bit number of FBIT.

Note: There are 28 sets of filters in product: i=0..27. Each set of filters consists of two 32-bit registers and CAN_FiBANK [2:1]. The corresponding filter registers can be modified only when the corresponding FACTx bit of CAN_FACT register is cleared or the FINITEN bit of CAN_FCTRL register is 1.

25 Secure digital input/output interface (SDIO)

25.1 Full name and abbreviation description of terms

Table 107 Full name and abbreviation description of terms

Full name in English	English abbreviation
First Input First Output	FIFO
Command Path State Machine	CPSM
Data Path State Machine	DPSM

25.2 Introduction

The secure digital input/output interface can connect SD card, SD I/O card, multi-media card (MMC) and CE-ATA card master interfaces, and provide data transmission between APB2 system bus and SD memory card, SD I/O card, MMC and CE-ATA device.

25.3 Main characteristics

- (1) SD card: Compatible with SD memory card specification version 2.0
- (2) SD I/O card: Compatible with SD I/O card specification version 2.0: support two different bus modes: 1 bit (default) and four bits.
- (3) MMC: Compatible with multimedia card system specification 4.2 and previous versions. Three different data bus modes are supported: 1 bit (default), 4 bits and 8 bits.
- (4) CE-ATA: Compatible with CE-ATA digital protocol version 1.1.
- (5) The data transmission rate in 8-bit bus mode is up to 48MHz
- (6) Interrupt and DMA request
- (7) Data and command output enable signal, used for controlling bidirectional driver.

Note: SDIO of current version only supports one SD/SD IO/MMC 4.2 card at the same time, however, it supports multiple MMC4.1 or cards of previous version.

25.4 Functional description

SDIO structure mainly contains two parts:

SDIO adapter: Realize the related functions of MMC/SD/SD I/O cards, and consist of control unit, data unit and command unit. The control unit manages

the clock signal, the data unit manages the data transmission, and the command unit manages the command transmission.

APB2 bus interface: Operate the registers in SDIO adapter, used for FIFO unit for data transmission, generate an interrupt and DMA request signal.

Figure 111 SDIO Structure Block Diagram

Table 108 SDIO Pin Definition

Pin	Direction	Description
SDIO_CK	Output	MMC/SD/SD I/O card clock, clock line from master to card
SDIO_CMD	Bilateral	MMC/SD/SD I/O card command, bidirectional command signal
SDIO_D[7:0]	Bilateral	MMC/SD/SD I/O card data, bidirectional data bus

25.4.1 SDIO bus topology

After power-on reset, the master must initialize the device through a special message-based bus protocol.

Each message is represented by one of the following parts:

- Command: Command is a token to start an operation, from the master to the card, and the command is transmitted to the CMD line serially.
- Response: From the card to the master, as a response to the previously received command, the response is transmitted onto the CMD serially.

- Data: It can be transmitted from the master to the card or from the card to the master. Transmit through data cable. The number of data cables for data transmission can be 1 (D0), 4 (D0-D3), or 8 (D0-D7).

The basic operation on the multimedia card/SD/SD I/O bus is command/response structure.

The data transmitted on SD/SD I/O memory card is transmitted in the form of data block; the data transmitted on MMC is transmitted in the form of data block or data stream; the data transmitted on CE-ATA device is also transmitted in the form of data block.

Figure 112 SDIO "No-response" and "No-data" Operation

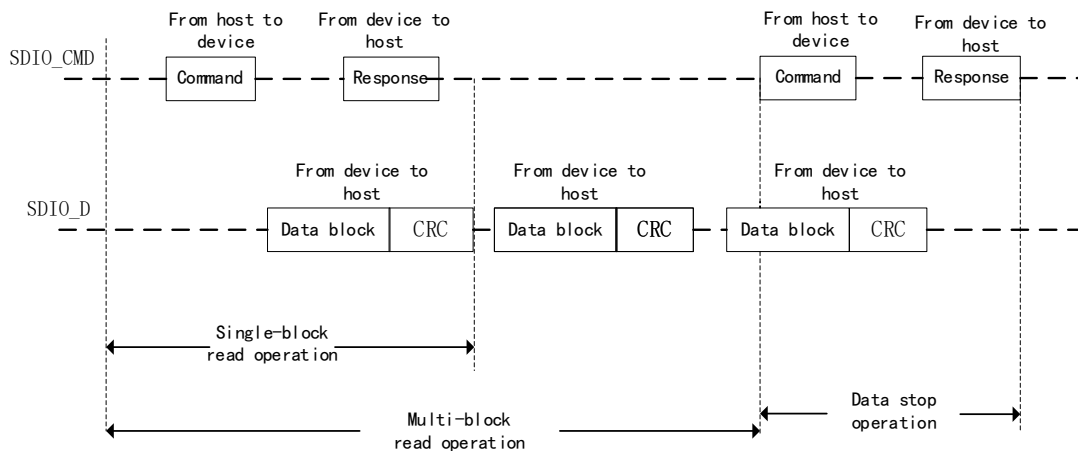

Figure 114 SDIO (Multi-) Data Block Write Operation

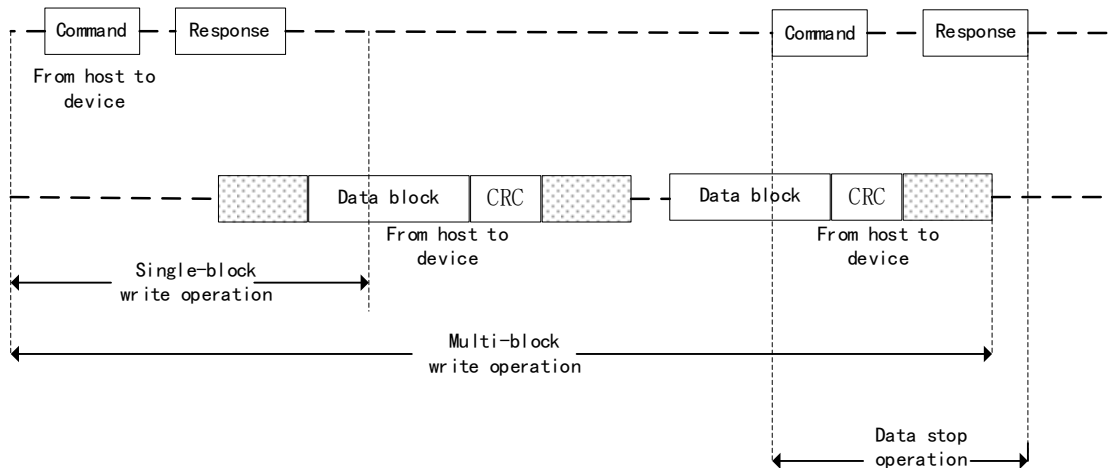

Figure 115 SDIO Data Flow Read Operation

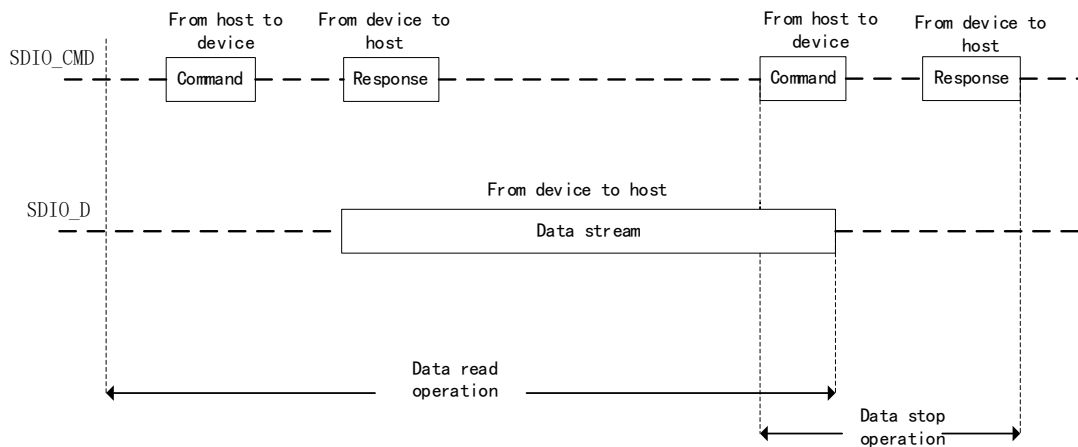

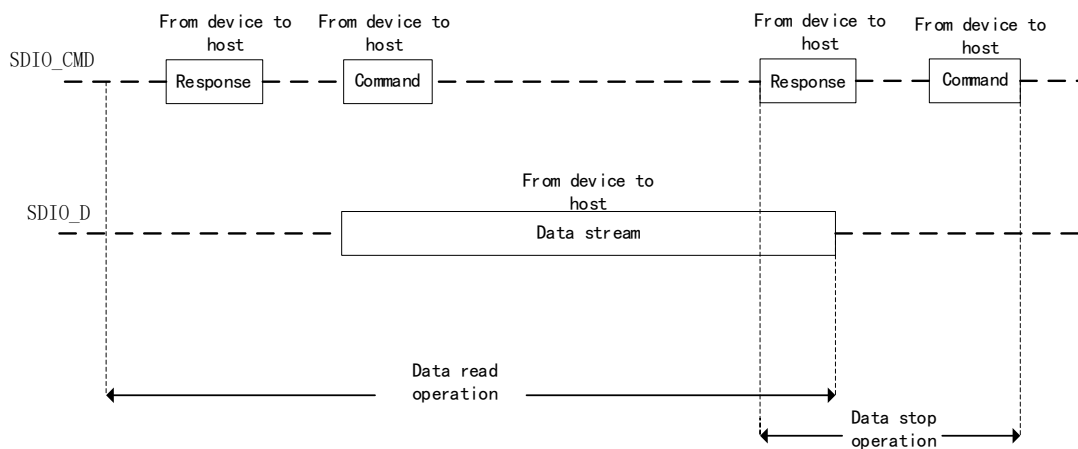

Figure 116 SDIO Data Flow Write Operation

25.4.2 SDIO Adapter

SDIO generates the following signals:

- **SDIO_CLK**: Clock provided by SDIO controller to the card. Each clock cycle directly transmits 1-bit command or data on the command line (SDIO_CMD) and all data lines (SDIO_D). SDIO_CLK frequency is within 0-20MHz for MMC card V3.31, within 0-48MHz for MMC card V4.2, and within 0-25MHz for SD or SD I/O card.
- **SDIO_CMD**: The signal is a bidirectional command channel, which is used for card initialization and command transmission. Command is sent from SDIO controller to the card, and the response is sent from the card to the master. There are two operation modes of CMD signal: the open-drain mode of initialization (used for MMC card V3.31 and previous versions) and the push-pull mode of command transmitting (SD, SD I/O, and MMC card V4.2 initialization are also push-pull mode).
- **SDIO_D[7:0]**: The signal lines are bidirectional data channels and in push-pull mode. By default, after power-on or reset, only D0 is used for data transmission. SDIO adapter can be configured with wider data bus for data transmission, using D0-D3 and D0-D7 (only on MMC V4.2).

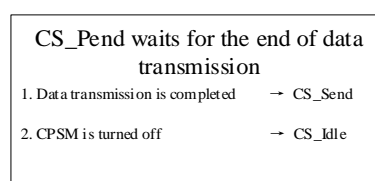

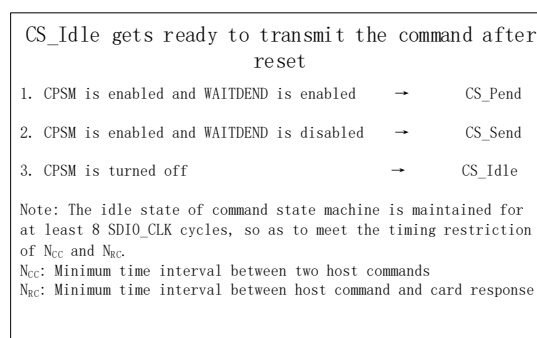

Control unit

The control unit includes power management and clock management functions.

Command unit

The command unit realizes transmitting commands to the card and receiving commands from the card, and the data transmission is controlled by the command state machine (CPSM).

Command state machine

CS_Send transmits commands

1. There is response after the command is transmitted → CS_Wait
2. There is no response after the command is transmitted → CS_Idle
3. CPSM is turned off → CS_Idle

CS_Wait waits for response start bit

1. Received the response (the start bit is detected) → CS_Wait
2. Receiving response times out → CS_Idle
3. CPSM is turned off → CS_Idle

Note: The command timeout period is fixed as 64 SDIO_CLK clock cycles

CS_Receive receives response and detects CRC

1. Receive the response in CE-ATA mode, disable CE-ATA interrupt and wait for enabling of CE-ATA device command completion signal → CS_Waitcompl
2. Receive the response in CE-ATA mode, disable CE-ATA interrupt and wait for disabling of CE-ATA device command completion signal → CS_Pend
3. CPSM is turned off → CS_Idle
4. Receive the response → CS_Idle
5. The command CRC detection fails → CS_Idle

CS_Waitcompl waits for CE-ATA device command completion signal

1. Receive CE-ATA command completion signal → CS_Idle
2. CPSM is turned off → CS_Idle
3. The command CRC detection fails → CS_Idle

Data unit

The data unit realizes the data transmission between the master and the card. When the data width is 8 bits, SDIO_D[7:0] signal line is used for data transmission. When the data width is 4 bits, SDIO_D[3:0] signal line is used for data transmission. When the data width is 1 bit, SDIO_D[0] signal line is used for data transmission.

Data transmission stream is controlled by data state machine (DPSM).

Data state machine

DS_Idle data unit is idle, waiting for transmitting and receiving data

1. DPSM is enabled and the data are transmitted from host to card → DS_WaitS
2. DPSM is enabled and the data are transmitted from card to host → DS_WaitR
3. DPSM is enabled, read wait has started and SDIO mode is enabled → DS_Readwait

DS_WaitS waits that the empty data FIFO flag is invalid or data transmission ends

1. Data transmission ends → DS_Idle
2. DPSM is turned off → DS_Idle
3. The empty data FIFO flag is invalid → DS_Send

DS_Send transmits data to the card

1. The data have been transmitted → DS_Busy
2. DPSM is turned off → DS_Idle
3. Data FIFO underrun error is transmitted → DS_Idle
4. Internal CRC error → DS_Idle

DS_Busy waits for CRC state flag

1. The data have been transmitted → DS_Busy
2. DPSM is turned off → DS_Idle
3. Data FIFO underrun error is transmitted → DS_Idle
4. Internal CRC error → DS_Idle

DS_WaitR waits for the start bit of received data

1. Data receiving ends → DS_Idle
2. DPSM is turned off → DS_Idle
3. Data timeout → DS_Idle
4. Receive the start bit before timeout → DS_Receive

DS_Receive receives the card data and writes them to data FIFO

1. The data block has been received → DS_WaitR
2. The data transmission ends → DS_WaitR
3. The data FIFO underrun is transmitted → DS_Idle
4. The data have been received, read wait starts and SDIO mode is enabled → DS_Readwait
5. DPSM is turned off or CRC error occurs → DS_Idle

DS_Readwait waits for "read wait stop" command	
1. "Read wait stop" is enabled	→ DS_WaitR
2. DPSM is turned off	→ DS_Idle

25.4.3 APB2 interface

APB2 interface realizes access to SDIO register, data FIFO and generation of interrupt and DMA request. It includes data FIFO unit, register unit and interrupt/DMA request control logic.

SDIO interrupt

When at least one of the selected state flags is high, the interrupt logic will generate an interrupt request. Interrupt enable register enables the interrupt logic to generate corresponding interrupt.

Data FIFO

The data FIFO unit has a data buffer area for receive and transmit FIFO. FIFO includes a data buffer with 32-bit width for each word and with depth of 32 words. The transmit FIFO is used when data needs to be written to the card; the data to be transmitted is written to the transmit FIFO through APB2 bus, and the data unit in SDIO adapter reads data from the transmit FIFO and then transmits the data to the card. The receive FIFO is used to read data from the card, and then write the data to be transmitted to the receive FIFO.

Register unit

The register unit includes all system registers and generates signals for communication between the control card and the controller.

25.4.4 Card Function Description

25.4.4.1 Card register

The card internally defines the interface registers: OCR, CID, CSD, EXT_CSD, RCA, DSR and SCR. These registers can access only through corresponding commands. OCR, CID, CSD and SCR registers include the specific information of the card. RCA and DSR registers are configuration registers for storing the actual configuration parameters. EXT_CSD register includes both the specific information of the card and the actual structure parameters.

OCR register: 32-bit operating condition register stores V_{DD} voltage description and memory mode indication (MMC) of the card. In addition, the register includes a state information bit. If the card power-on process has been completed, this state bit will be set. This register is slightly different between

MMC and SD card. The master can use CMD1 (MMC), ACMD41 (SD memory card), and CMD5 (SD I/O) to capture the content of this register.

CID register: The card identification register (CID) is 128-bit wide. It contains the card identification information used in the card identification phase. Each read/write (RW) card shall have a unique identification number.

CSD register: The specific card data register provides the content information in the access card. CSD defines data format, error correction type, maximum data access time, and data transmission speed.

Extended CSD register: Only MMC4.2 has this register. Extended CSD register defines the card attributes and selection mode. Its length is 512 bytes. At most 320 bytes are the attribute section, which defines the function of the card and cannot be modified by the master. At least 192 bytes are the mode section, which defines under which configuration the card works.

RCA register: The writable 16-bit relative card address register stores the card address, which is released by the card during card initialization. This address is used for communication between the addressing master and the card after the card identification process.

DSR register: 16-bit drive stage register, which can be used to improve bus performance in extended operating conditions (depending on bus length, transmission rate and other parameters).

SCR register: Only SD/SD I/O has this register.

25.4.4.2 Command

The command for the control card consists of four different types:

Table 109 Command Type

Command type	Meaning
Broadcast command (BC)	Transmit to all cards, but there is no response returned
Broadcast command with response (BCR)	Transmit to all cards and receive response from all cards
Addressing (point-to-point) command (AC)	Transmit to addressing card, and there is no data transmission on SDIO_D line
Addressing (point-to-point) data transmission command (ADTC)	Transmit to addressing card, and there is data transmission on SDIO_D line

Command format

All command formats are 48-bit fixed code length, which requires 1.92us (25MHz), 0.96us (50MHz) and 0.92us (52MHz) transmission time.

Table 110 Command Format

Bit	47	46	[45:40]	[39:8]	[7:1]	0
Width	1	1	6	32	7	1
Numerical Value	0	1	-	-	-	1
Description	Start Bit	Transmission Bit	Command Index	Parameter	CRC7	End bit

SD I/O supports two types of response, both of which support CRC error detection.

- 48-bit short response
- 136-bit long response

Table 111 Short Response Format

Bit	47	46	[45:40]	[39:8]	[7:1]	0
Width	1	1	6	32	7	1
Numerical Value	0	0	-	-	-	1
Description	Start Bit	Transmission Bit	Command Index	Parameter	CRC7 or (1111111)	End bit

Table 112 Long Response Format

Bit	135	134	[133:128]	[127:1]	0
Width	1	1	6	127	1
Numerical Value	0	0	111111	-	1
Description	Start Bit	Transmission Bit	Reserved	CID or CSD	End bit

Command description

Table 113 Basic Command

Command Index	Type	Parameter	Response format	Short name	Description
CMD0	bc	[31:0] Stuffing bit	-	GO_IDLE_STATE	Reset all cards to the idle state.
CMD1	bc	[31:0]OCR	R3	SEND_OP_COND	In the idle state, request the card to transmit the response (including the content of the operating condition register) through the CMD line
CMD2	bcr	[31:0] Stuffing bit	R2	ALL_SEND_CID	Request any card to transmit CID data through the CMD line (all cards connected to the master will respond)

Command Index	Type	Parameter	Response format	Short name	Description
CMD3	bcr	[31:0] Stuffing bit	R6	SEND_RELATIVE_ADDRESS	Request the card to release new relative card address (RCA)
CMD4	bc	31:16]DSR [15:0]Stuffing bit	-	SET_DSR	Set DSR registers of all cards.
CMD5	bcr	[31:25]Reserved bit [24]S18R [23:0]I/O OCR	R4	IO_SEND_OP_COND	Only apply to I/O card. Query voltage range of all IO cards.
CMD6	ac	[31:26]Set to 0 [25:24]Access [23:16]Index [15:8]Value [7:3]Set to 0 [2:0]Command set	R1b	SWITCH	Only apply to MMC card. Switch the operation mode of the selected card or modify EXT_CSD register.
CMD7	ac	[31:16]RCA [15:0]Stuffing bit	R1b	SELECT/DESELECT_CARD	Used for switching of the card state.
CMD8	bcr	[31:12]Reserved bit [11:8]Operating voltage (VHS) [7:0]Inspection mode	R7	SEND_IF_COND	Transmit interface conditions to SD card, including master power supply voltage information and query whether the card supports the voltage. The reserved bit should be set to 0.
CMD9	ac	[31:16]RCA [15:0]Stuffing bit	R2	SEND_CSD	The selected card transmits to its card specific data (CSD) through CMD
CMD10	ac	[31:16]RCA [15:0]Stuffing bit	R2	SEND_CID	The selected card transmits to its card identification (CID) through CMD

Command Index	Type	Parameter	Response format	Short name	Description
CMD12	ac	[31:0] Stuffing bit	R1b	STOP_TRANSMISSION	Force the card to stop transmission.
CMD13	ac	[31:16]RCA [15:0]Stuffing bit	R1	SEND_STATUS	The selected card transmits its state register.
CMD14	adtc	[31:0] Stuffing bit	R1	BUSTEST_R	The master reads the reverse bus test data mode from the card.
CMD15	ac	[31:16]RCA [15:0]Stuffing bit	-	GO_INACTIVE_STATE	Convert the selected card to inactive state.
CMD19	adtc	[31:0] Stuffing bit	R1	BUSTEST_W	The master transmits the bus test mode to the card.

Table 114 Block-oriented Write Command

Command Index	Type	Parameter	Response format	Short name	Description
CMD23	ac	[31:16]Set to 0 [15:0]Number of blocks	R1	SET_BLOCK_COUNT	Define the number of blocks to be transferred in subsequent blocks or write commands.
CMD24	adtc	[31:0]Data address	R1	WRITE_BLOCK	Write a block according to the selected length of SET_BLOCKLEN command.
CMD25	adtc	[31:0]Data address	R1	WRITE_MULTIPLE_BLOCK	Continue to write the data block until receiving STOP_TRANSMISSION command or achieving the specified number of blocks.
CMD26	adtc	[31:0] Stuffing bit	R1	PROGRAM_ID	Program the card identification register. This command can be sent to each card once only. The programming involves hardware changes to prevent subsequent operations after the first programming. Reserved to the manufacturer through this command.

Command Index	Type	Parameter	Response format	Short name	Description
CMD27	adtc	[31:0] Stuffing bit	R1	PROGAM_CSD	Program the programmable bits in the card CSD.
CMD28	ac	[31:0]Data address	R1b	SET_WRITE_PROT	If the card has write protection function, this command will set the write protection bit of the specified group. The write protection characteristic is set in the special data area of the card (WP_GRP_SIZE)
CMD29	ac	[31:0]Data address	R1b	CLR_WRITE_PROT	If the card has write protection function, this command will clear the write protection bit of the addressing group.
CMD30	adtc	[31:0]Write protection data address	R1	SEND_WRITE_PROT	If the card has write protection function, the command requests the card to transmit write protection bit state.

25.4.5 Specific Operations

25.4.5.1 SD I/O card operations

SD I/O card (including IO card and combined card) supports the following specific operations:

- Read wait operation
- Pause/Recovery operation
- Interrupt

SDIO supports these operations only when setting SDIO_DCTRL SDIOEN bit; except for read pause, it does not require special hardware operation.

SD I/O read wait operation

Read wait (RW) is only used for SD I/O 1-bit and 4-bit modes. Read wait operation allows a master to transmit a signal to stop data transmission when performing the operation of reading multiple blocks for the card, and allows the master to transmit commands to any function in the SD I/O card.

Before receiving the first data block, it is allowed to start the read wait process, enable the data channel (DTEN bit is set to 1), enable SDIO specific operation (SDIOEN bit is set to 1), and start read wait. At the same time, the data are transmitted from the card to the SDIO master, and DPSM will directly enter the read wait state from idle state.

In the read wait state, after 2 SDIO_CLK clock cycles, DPSM drive SDIO_D2 is 0. In this state, if RWSTOP bit is set, DPSM will stay for 2 more SDIO_CLK clock cycles in the waiting state, and (according to SDIO specification) the drive SDIO_D2 is 1 in one clock cycle. Then DPSM starts to wait to receive data from the card. When receiving data block, DPSM will not enter the read wait state even if the start wait is set.

SDIO card cannot perform the above read wait operation, SDIO can stop SDIO_CLK entering the read wait and two SDIO_CLK cycles later after receiving the current data block, DPSM stops the clock and recovers the clock after setting the read wait start bit.

Figure 117 Read Wait Operation Using SDIO_D2 Signal Line

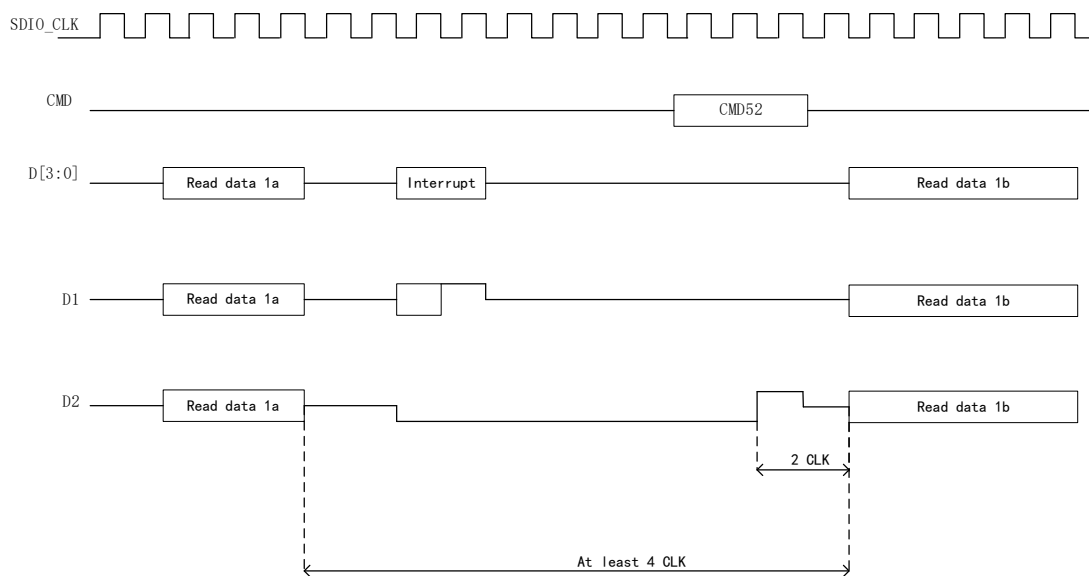

Figure 118 Read Wait Operation through Stop SDIO_CLK

SDIO interrupt

When the SDIOEN bit is set, the SDIO master detects SDIO interrupt on SDIO_D signal line.

25.4.5.2 CE-ATA specific operation

CE-ATA device supports the following specific operation:

- Receive command completion signa
- Transmit command completion and closing signal

SDIO supports these operations only when SDIO_CMD ATACMD bit is set.

Command completion signal

CE-ATA defines the command completion signal. The device uses this signal to notify the master that the ATA command is completed or encounters an error, and ATA command is terminated

Command completion and closing signal

The master can transmit a command to complete the function of closing the signal and canceling the device return command to complete the signal.

If the "Enable CMD end bit" of ATACMD is not set and the "Non-terminal enable bit" of INTDIS is set, the command completion and closing signal will be sent 8-bit cycle later after receiving a short response.

25.4.6 Card state register functional description

The response format R1 contains a 32-bit card state field, which is used to transmit the card state information to the card master (the information may be stored in the local state register). Unless otherwise specified, the state returned by the card is always related to the previous command.

The following table defines different state information:

Table 115 Different State Information Types

Abbreviation	Definition
E	Error bit
S	State bit
R	Detection bit, set according to the actual command response
X	Detection bit, set during the execution of command. The master of SDIO card reads these bits and queries the card state by transmitting the state command.

Table 116 Clear Conditions

Abbreviation	Definition
A	According to current state of the card
B	Always related to previous command. Can be cleared once correct command is received (with delay of one command).
C	Clear once read

Table 117 Card State

Bit	Name	Type	Numerical Value	Description	Clear conditions
1:0				Reserved for the test mode of the manufacturer.	

Bit	Name	Type	Numerical Value	Description	Clear conditions
2	Reserved for the command related to application.				
3	AKE_SEQ_ERROR	ER	0=No error 1=Error	Verification sequence error.	C
4	Reserved for SD I/O card				
5	APP_CMD	SR	0=Not allowed 1=Allowed	The card expects ACMD, or the instruction command has been interpreted as an ACMD command.	C
6	Reserved				
7	SWITCH_ERROR	EX	0=No error 1=Conversion error	The card is not switched to the desired mode according to the requirements of SWITCH command.	B
8	READY_FOR_DATA	SR	0=Not ready 1=Ready	Corresponding to the empty signal of the buffer on the bus.	
12:9	CURRENT_STATE	SR	0=Idle 1=Ready 2=Identify 3=Standby 4=Transmit 5=Data 6=Receive 7=Program 8=Disconnect 9=Busy test 10~15=Reserved	The state of the state machine in the card when receiving a command. If the execution of a command causes a state change, the change will be reflected in the response of next command. These four bits are interpreted by decimal numbers 0 to 15.	B
13	ERASE_RESET		0=Clear 1=Set	Because a command other than the erase sequence (rather than CMD35, CMD36, CMD38 or CMD13 command) is received, the sequence of entering the erase process is aborted.	C
14	CARD_ECC_DISABLED	SX	0=Allowed 1=Not allowed	Internal ECC is not used during execution of the command.	A

Bit	Name	Type	Numerical Value	Description	Clear conditions
15	WP_ERASE_SKIP	EX	0=Not protected 1=Protected	Encounter existing write protection data block, and only part of address space is erased.	C
16	CID/CSD_OVERWRITE	EX	0=No error 1=Error	It can be any of the following errors: It has been written into the CID register and cannot be overridden The read-only part of the CSD does not match the content of the card Attempt to reverse copy or permanent write protection, i.e., restore or release the write protection.	C
17	Reserved				
18	Reserved				
19	ERROR	EX	0=No error 1=Error	Generate an error related to the previous master command executed (not defined in the standard) Error inside the card (such as read or write error).	C
20	CC_ERROR	ER	0=No error 1=Error	Error inside the card (not defined in the standard), which has nothing to do with the command of the master.	C
21	CARD_ECC_FAILED	EX	0=Succeeded 1=Failed	ECC check is implemented in the card, but it fails when correcting the data.	C
22	ILLEGAL_COMMAND	ER	0=No error 1=Error	The command is illegal for current card state.	B
23	COM_CRC_ERROR	ER	0=No error 1=Error	CRC parity error in previous command.	B
24	LOCK_UNLOCK_FAILED	EX	0=No error 1=Error	Sequence error of command or wrong password detected in lock/unlock.	C

Bit	Name	Type	Numerical Value	Description	Clear conditions
25	CARD_IS_LOCKED	SR	0=Card unlocked 1=Card locked	When this bit is set, it means the card has been locked.	A
26	WP_VIOLATION	EX	0=No error 1=Error	Attempt to program the data block of a write protection.	C
27	ERASE_PARAM	EX	0=No error 1=Error	Illegal erase group selected when erasing.	C
28	ERASE_SEQ_ERROR		0=No error 1=Error	The sequence of transmitting erase command is wrong.	C
29	BLOCK_LEN_ERROR		0=No error 1=Error	The parameters of SET_BLOCKLEN command exceed the maximum allowable range of the card, or the previously defined data block length is illegal for the current command (for example, the master transmits a write command, and the current block length is less than the minimum allowable length of the card, while some data blocks are not allowed to be written).	C
30	ADDRESS_MISALIGN		0=No error 1=Error	The first block defined by the address parameter in the command (compared with the current block length) is not aligned with the physical block of the card. A multi-data block or data stream read/write operation (even starting from a legal address) attempts to read or write a data block that is not aligned with the physical block.	C

Bit	Name	Type	Numerical Value	Description	Clear conditions
31	ADDRESS_OUT_OF_RANGE	ERX	0=No error 1=Error	The address parameter in the command is beyond the allowed range of the card. A multi-data block or data stream read/write operation (even starting from a legal address) attempts to read or write the part beyond the capacity of the card.	C

25.4.6.1 SD state register functional description

The SD state includes the state bits related to the specific functions of the SD memory card and some state bits related to future applications. The length of the SD state is a 512-bit data block. After receiving the ACMD13 command (CMD55, then CMD13), the content of this register will be transmitted to the SDIO card host. The ACMD13 command can be sent only when the card is in transmission state (the card has been selected).

The following table defines different SD state register information.

Table 118 SD State Register Information

Abbreviation	Definition
E	Error bit
S	State bit
R	Detection bit, set according to the actual command response
X	Detection bit, set during the execution of command. The master of SDIO card reads these bits and queries the card state by transmitting the state command.

Note: For the abbreviations and definitions of related types and clear condition fields in the table, see.

Table 119 Clear Conditions

Abbreviation	Definition
A	According to current state of the card
B	Always related to previous command. Can be cleared once correct command is received (with delay of one command).
C	Clear once read

Table 120 SD State

Bit	Name	Type	Numerical Value	Description	Clear conditions
311:0	Reserved to the manufacturer				

Bit	Name	Type	Numerical Value	Description	Clear conditions
399:312	Reserved				
401:400	ERASE_OFF SET				
407:402	ERASE_TIME OUT	S R	Fixed offset value added in erase	(See the instructions below)	A
423:408	ERASE_SIZE	S R	Erase the timeout value of specified range of UNIT_OF_ERASE_AU	(See the instructions below)	A
427:424	Reserved	S R	The number of AU that can be erased at a time	(See the instructions below)	A
431:428	AU_SIZE	S R	AU size (see the instructions below)	(See the instructions below)	A
439:432	PERFORMANCE_MOVE	S R	Transmission performance in 1MB/s (see the instructions below)	(See the instructions below)	A
447:440	SPEED_CLASS	S R	Speed type of the card (see the instructions below)	(See the instructions below)	A
479:448	SIZE_OF_PROTECTED_AREA	S R	Size of protected area (see the instructions below)	(See the instructions below)	A
495:480	SD_CARD_TYPE	S R	'00xxh'= SD memory card in physical specification version 1.01~2.00 ('x' means any value). The defined cards are: '0000'= Universal SD read-write card '0001'= SD ROM card	The low 8 bits of this field can define different variants of SD memory card in the future (each bit can be used to define different SD types). The high 8 bits can be used to define SD cards that do not comply with the current SD physical layer specification.	A
508:496	Reserved				

Bit	Name	Type	Numerical Value	Description	Clear conditions
509	SECURED_MODE	S R	0=Not in the secret mode 1=In the secret mode	The card is in secret operation mode (see "SD Confidentiality Specification").	A
511:510	DAT_BUS_WIDTH	S R	00=1 (default) 01-Reserve 10=4-bit width 11=Reserved	Current data bus width defined by SET_BUS_WIDTH command.	A

SIZE_OF_PROTECTED_AREA

The way of setting this bit is different between standard-capacity card and high-capacity card:

- For the standard-capacity card, the capacity of the protected area is calculated as follows:

$$\text{Protected area} = \text{SIZE_OF_PROTECTED_AREA} * \text{MULT} * \text{BLOCK_LEN}$$

The unit of SIZE_OF_PROTECTED_AREA is MULT * BLOCK_LEN.

- For the high-capacity card, the capacity of the protected area is calculated as follows:

$$\text{Protected area} = \text{SIZE_OF_PROTECTED_AREA}$$

The unit of SIZE_OF_PROTECTED_AREA is byte.

SPEED_CLASS

These 8 bits indicate the type of speed and can be used for calculating the value of PW/2 (PW is the performance of write).

Table 121 Speed Type Code

SPEED_CLASS	Definition of Numerical Value
00h	Type 0
01h	Type 2
02h	Type 4
03h	Type 6
04h~FFh	Reserved

PERFORMANCE_MOVE

These 8 bits indicate mobility performance (Pm) in 1MB/s. If the card does not use RU (record unit) mobile data, it should be considered that Pm is infinitely

great. Setting this field for FFH means infinitely great.

Table 122 Mobility Performance Code

PERFORMANCE_MOVE	Definition of Numerical Value
00h	Undefined
01h	1MB/s
02h	2MB/s
.....
Feh	254MB/s
FFh	Infinitely great

AU_SIZE

These four bits indicate the length of AU, and the value is the multiple of the power of 2 in 16KB.

Table 123 AU_SIZE Codes

AU_SIZE	Definition of Numerical Value
00h	Undefined
01h	16KB
02h	32KB
03h	64KB
04h	128KB
05h	256KB
06h	512KB
07h	1MB
08h	2MB
09h	4MB
Ah~Fh	Reserved

According to the capacity of the card, the maximum AU length is defined by the following table. The card can set any AU length between the RU length and the maximum AU length.

Table 124 Maximum AU Length

Capacity	Maximum AU length
16MB~64MB	512KB
128MB~256MB	1MB
512MB	2MB
1GB~32GB	4MB

ERASE_SIZE

This 16-bit field gives the value of NERASE, and when MERASE number of AU is erased, ERASE_TIMEOUT defines the timeout period.

If the master can determine the value of NERASE in a certain erase, the erase progress can be displayed.

Table 125 ERASE_SIZE Codes

ERASE_SIZE	Definition of Numerical Value
0000h	Overtime calculation not supporting erase
0001h	One AU
0002h	Two AUs
0003h	Three AUs
.....
FFFFh	65535 AUs

ERASE_TIMEOUT

These 6 bits give TERASE. When multiple AUs are erased, TERASE gives the erase timeout calculated from offset.

Table 126 Erase Timeout Codes

ERASE_TIMEOUT	Definition of Numerical Value
00	Overtime calculation not supporting erase
01	1 second
02	2 seconds
03	3 seconds
.....
63	63 seconds

ERASE_OFFSET

These two bits give TOFFSET, and when both ERASE_SIZE and ERASE_TIMEOUT are 0, this value is meaningless.

Table 127 Erase Offset Codes

ERASE_OFFSET	Definition of Numerical Value
0	0 second
1	1 second
2	2 seconds
3	3 seconds

25.5 Register address mapping

Table 128 SDIO Register Address Mapping

Register name	Description	Offset address
SDIO_PWRCTRL	SDIO power control register	0x00
SDIO_CLKCTRL	SDIO clock control register	0x04
SDIO_ARG	SDIO parameter register	0x08
SDIO_CMD	SDIO command register	0x0C
SDIO_CMDRES	SDIO command response register	0x10
SDIO_RESx	SDIO response x register	$0x14 + 4 * (x-1)$, wherein $x=1...4$
SDIO_DATATIME	SDIO data timer register	0x24
SDIO_DATALEN	SDIO data length register	0x28
SDIO_DCTRL	SDIO data control register	0x2C
SDIO_DCNT	SDIO data counter register	0x30
SDIO_STS	SDIO state register	0x34
SDIO_ICF	SDIO clear interrupt register	0x38
SDIO_MASK	SDIO interrupt mask register	0x3C
SDIO_FIFOCNT	SDIO counter register	0x48
SDIO_FIFODATA	SDIO data FIFO register	0x80

25.6 Register functional description

The device communicates with the system through the 32-bit control registers that can be operated on APB2. These peripheral registers must be operated in word (32-bit) mode.

25.6.1 SDIO power control register (SDIO_PWRCTRL)

Offset address: 0x00

Reset value: 0x0000 0000

Field	Name	R/W	Description
1:0	PWRCTRL	R/W	Power Supply Control Select current function state of card clock. 00: Power off, card clock stopped. 01: Reserved. 10: Reserved power-on state. 11: Power-on state, card clock started.
31:2	Reserved		

Note: This register cannot be written within 7 HCLK clock cycles after data write.

25.6.2 SDIO clock control register (SDIO_CLKCTRL)

Offset address: 0x04

Reset value: 0x0000 0000

SDIO_CLKCTRL register controls SDIO_CLK to output the clock.

Field	Name	R/W	Description
7:0	CLKDIV	R/W	Clock Divide Factor This domain defines the division factor between input clock (SDIOCLK) and output clock (SDIO_CLK): $SDIO_CLK\ frequency = SDIOCLK / [CLKDIV + 2]$.
8	CLKEN	R/W	Clock Enable 0: Disable 1: Enable
9	PWRSVAV	R/W	Power Saving Mode Configuration Reduce power consumption by disabling SDIO_CLK outputs beyond the bus activity. 0: Enable 1: Disable
10	BYPASSEN	R/W	Clock Divider Bypass Enable Before driving SDIO_CLK to output signals, it is required to divide the frequency of SDIOCLK; however, if the divider is bypassed, SDIOCLK will directly drive SDIO_CLK to output signals. 0: Disable 1: Enable
12:11	WBSEL	R/W	Wide Bus Mode Select Select bus mode for different bits, corresponding to different SDIO_D bits. 00: Default, using SDIO_D0 01: 4 bits, using SDIO_D[3:0] 10: 8 bits, using SDIO_D[7:0] 11: Reserved
13	DEPSEL	R/W	SDIO_CLK Dephasing Select Select SDIOCLK rising edge or falling edge to generate SDIO_CLK. 0: Rising edge 1: Falling edge
14	HFCEN	R/W	HW Flow Control Enable 0: Disable 1: Enable
31:15	Reserved		

Note:

- (1) When SD/SD I/O card or multimedia card is in identification mode, the frequency of SDIO_CLK must be less than 400kHz.
- (2) When all cards have been assigned the corresponding address, the clock frequency can be changed to the maximum frequency allowed by the card bus.

- (3) This register cannot be written within 7 HCLK clock cycles after writing data. For SD I/O card, SDIO_CLK can be stopped during read wait period, and then SDIO_CLKCTRL register does not control SDIO_CLK.

25.6.3 SDIO parameter register (SDIO_ARG)

Offset address: 0x08

Reset value: 0x0000 0000

Command parameters are also part of the command, and SDIO_ARG register contains 32-bit command parameters and is sent to the card together with the command.

Field	Name	R/W	Description
31:0	CMDARG	R/W	Command Argument Store the command parameters.

25.6.4 SDIO command register (SDIO_CMD)

Offset address: 0x0C

Reset value: 0x0000 0000

SDIO_CMD register contains command index and command type bit.

Field	Name	R/W	Description
5:0	CMDINDEX	R/W	Command Index The command index, as part of the command, is transmitted to the card together with the command.
7:6	WAITRES	R/W	Wait for Response Indicate whether CPSM needs to wait for the response, and if it needs to wait for the response, the response type will be indicated. 00: No response, expecting CMDSENT flag 01: Short response, expecting CMDREND or CCRCFAIL flag 10: No response, expecting CMDSENT flag 11: Long response, expecting CMDREND or CCRCFAIL flag
8	WAITINT	R/W	CPSM Waits for Interrupt Request CPSM enables or disables the command timeout control and waits for interrupt request. 0: Enable 1: Disable
9	WENDDATA	R/W	CPSM Waits for Ends of Data Transfer (CmdPend Internal Signal) 0: Invalid 1: CPSM waits for the end of data transmission before starting to transmit a command.
10	CPSMEN	R/W	Command Path State Machine (CPSM) Enable Enable CPSM. 0: Disable 1: Enable
11	SDIOSC	R/W	SD I/O Suspend Command 0: Invalid 1: The command to be sent is a suspend command (only used for SD I/O card).

Field	Name	R/W	Description
12	CMDCPEN	R/W	Enable CMD Completion Enable command completion signal. 0: Disable 1: Enable
13	INTEN	R/W	Interrupt Enable 0: Enable 1: Disable
14	ATACMD	R/W	CE-ATA Command 0: Invalid 1: Switch CPSM to CMD61
31:15	Reserved		

Note:

- (1) This register cannot be written within 7 HCLK clock cycles after writing data.
- (2) The multimedia card can transmit two kinds of responses: 48-bit short response or 136-bit long response. The SD card and SD I/O card can only transmit short response, parameters can be changed according to the type of response, and the software will distinguish the type of response according to the command sent. CE-ATA devices only transmit short responses.

25.6.5 SDIO command response register (SDIO_CMDRES)

Offset address: 0x10

Reset value: 0x0000 0000

Field	Name	R/W	Description
5:0	CMDRES	R	Response Command Index Store the command index in the finally received command response.
31:6	Reserved		

25.6.6 SDIO response x register (SDIO_RESx)

Offset address: $0x14 + 4 * (x-1)$, wherein $x=1...4$

Reset value: 0x0000 0000

SDIO_RES1/2/3/4 register contains the card state, namely, some information about the received response.

Field	Name	R/W	Description
31:0	CARDSTSx	R	See the table below.

The state length of the card is 32 bits or 127 bit according to the response state.

Table 129 Response Type and SDIO_RESPx Register

Register	Short response	Long response
SDIO_RES1	Card state [31:0]	Card state [127:96]
SDIO_RES2	Unused	Card state [95:64]
SDIO_RES3	Unused	Card state [63:32]
SDIO_RES4	Unused	Card state [31:1]

Always receive the most significant bit of card state first, and the lowest bit of SDIO_RES3 register is always 0.

25.6.7 SDIO data timer register (SDIO_DATATIME)

Offset address: 0x24

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	DATATIME	R/W	Data Timeout Period Record the data timeout period in card bus clock cycle.

Note: Before writing the data control register for data transmission, first write the data timer register and data length register.

25.6.8 SDIO data length register (SDIO_DATALEN)

Offset address: 0x28

Reset value: 0x0000 0000

Field	Name	R/W	Description
24:0	DATALEN	R/W	Data Length Byte length of data to be transmitted.
31:25	Reserved		

Note: For block data transfer, the value in SDIO_DATALEN must be a multiple of the data block length. Before writing SDIO_DCTRL for data transmission, first write SDIO_DATATIME and SDIO_DATALEN.

25.6.9 SDIO data control register (SDIO_DCTRL)

Offset address: 0x2C

Reset value: 0x0000 0000

SDIO_DCTRL register control data channel state channel (DPSM).

Field	Name	R/W	Description
0	DTEN	R/W	Data Transfer Enabled 0: Disable 1: Enable
1	DTDRCFG	R/W	Data Transfer Direction Configuration 0: From controller to card 1: From card to controller
2	DTSEL	R/W	Data Transfer Mode Select 0: Block data transfer 1: Stream data transfer
3	DMAEN	R/W	DMA Enable 0: Disable 1: Enable
7:4	DBSIZE	R/W	Data Block Size Define the data bock length: 0000: Block length=20=1 byte 0001: Block length=21=2 bytes 0010: Block length=22=4 bytes 0011: Block length=23=8 bytes

Field	Name	R/W	Description
			0100: Block length=24=16 bytes 0101: Block length=25=32 bytes 0110: Block length=26=64 bytes 0111: Block length=27=128 bytes 1000: Block length=28=256 bytes 1001: Block length=29=512 bytes 1010: Block length=210=1024 bytes 1011: Block length=211=2048 bytes 1100: Block length=212=4096 bytes 1101: Block length=213=8192 bytes 1110: Block length=214=16384 bytes 1111: Reserved
8	RWSTR	R/W	Read Wait Start 0: Invalid 1: Start read wait operation
9	RWSTOP	R/W	Read Wait Stop Enable If RWSTR is set, stop read operation can be enabled. 0: Disable 1: Enable
10	RDWAIT	R/W	Read Wait Mode 0: Control stop SDIO_D2 1: Control use SDIO_DK
11	SDIOF	R/W	SD I/O Enable Functions If this bit is set, DPSM will execute specific operation of SD I/O card.
31:12	Reserved		

25.6.10 SDIO data counter register (SDIO_DCNT)

Offset address: 0x30

Reset value: 0x0000 0000

When DPSM enters Wait_R or Wait_S state from the idle state, SDIO_DCNT loads values from SDIO_DATALEN, and in the data transmission process, the counter will count down to 0, and then DPSM will enter the idle state and set DATAEND flag.

Field	Name	R/W	Description
24:0	DATAcnt	R	Data Count Number Store the number of data bytes to be transmitted.
31:25	Reserved		

Note: This register can be read only by the end of data transmission.

25.6.11 SDIO state register (SDIO_STS)

Offset address: 0x34

Reset value: 0x0000 0000

SDIO_STS is a read-only register, and it contains two kinds of flags:

(1) Static flag (bit [23:22, 10:0]): Write SDIO interrupt clear register to clear these bits.

(2) Dynamic flag (bits [21:11]): The state of these bits changes according to the logic of corresponding part.

Field	Name	R/W	Description
0	COMRESP	R	Command Response Received (CRC detection failure)
1	DBDR	R	Data Block Sent/Received (CRC detection failure)
2	CMDRESTO	R	Command Response Timeout Command timeout period is 64 SDIO_CLK clock cycles.
3	DATATO	R	Data Timeout
4	TXUDRER	R	Transmit FIFO Underrun Error
5	RXOVRER	R	Received FIFO Overrun Error
6	CMDRES	R	Command Response (CRC detection succeeded)
7	CMDSENT	R	Command Sent (No Response Required)
8	DATAEND	R	Data end (data counter, SDIO_DCNT=0)
9	SBE	R	Start Bit Not Detected On All Data Signals In Wide Bus Mode
10	DBCP	R	Data Block Sent/Received
11	CMDACT	R	Command Transfer In Progress
12	TXACT	R	Data Transmit In Progress
13	RXACT	R	Data Receive In Progress
14	TXFHF	R	Transmit FIFO Half Empty: At least 8 more words can be written in FIFO.
15	RXFHF	R	Receive FIFO Half Full There are at least eight words in FIFO.
16	TXFF	R	Transmit FIFO Full
17	RXFF	R	Receive FIFO Full If the hardware flow control is used, the RXFF signal will become effective when the FIFO is still 2 words short.
18	TXFE	R	Transmit FIFO Empty If the hardware flow control is used, the TXFE signal will become effective when the FIFO contains 2 words.
19	RXFE	R	Receive FIFO Empty
20	TXDA	R	Data Available In Transmit FIFO
21	RXDA	R	Data Available In Receive FIFO
22	SDIOINT	R	SDIO Interrupt Received
23	ATAEND	R	CE-ATA Command Completion Signal Received For CMD61
31:24	Reserved		

25.6.12 SDIO clear interrupt register (SDIO_ICF)

Offset address: 0x38

Reset value: 0x0000 0000

SDIO_ICF is a write-only register, and the corresponding bit in SDIO_STS state register will be cleared in corresponding register bit.

Field	Name	R/W	Description
0	CRCE	R/W	COMRESP Flag Clear Clear COMRESP flag. 0: Invalid 1: Clear
1	DBCE	R/W	DBDR Flag Clear Clear DBDR flag. 0: Invalid 1: Clear
2	CRT0	R/W	CMDRESTO Flag Clear Clear CMDRESTO flag. 0: Invalid 1: Clear
3	DTO	R/W	DATATO Flag Clear Clear DATATO flag. 0: Invalid 1: Clear
4	TXFUE	R/W	TXUDRER Flag Clear Clear TXUDRER flag. 0: Invalid 1: Clear
5	RXFOE	R/W	RXOVRER Flag Clear Clear RXOVRER flag. 0: Invalid 1: Clear
6	CMDRES	R/W	CMDRES Flag Clear Clear CMDRES flag. 0: Invalid 1: Clear
7	CMDSENT	R/W	CMDSENT Flag Clear Clear CMDSENT flag. 0: Invalid 1: Clear
8	DATAEND	R/W	DATAEND Flag clear Clear DATAEND flag. 0: Invalid 1: Clear
9	SBE	R/W	SBE Flag Clear Clear SBE flag. 0: Invalid 1: Clear

Field	Name	R/W	Description
10	DBCP	R/W	DBCP Flag Clear Clear DBCP flag. 0: Invalid 1: Clear
21:11	Reserved		
22	SDIOIT	R/W	SDIOIT flag clear bit Clear SDIOIT flag. 0: Invalid 1: Clear
23	ATAEND	R/W	ATAEND flag clear bit Clear ATAEND flag. 0: Invalid 1: Clear
31:24	Reserved		

25.6.13 SDIO interrupt mask register (SDIO_MASK)

Offset address: 0x3C

Reset value: 0x0000 0000

Set or cleared by software.

When the corresponding bit is set to 1, SDIO_MASK interrupt mask register decides which state bit generates an interrupt.

Field	Name	R/W	Description
0	CCRCFAIL	R/W	Command CRC Fail Interrupt Enable Enable/Disable command block CRC detection failure interrupt. 0: Disable 1: Enable
1	DCRCFAIL	R/W	Data CRC Fail Interrupt Enable Enable/Disable data block CRC detection failure interrupt. 0: Disable 1: Enable
2	CMDTO	R/W	Command Timeout Interrupt Enable Enable/Disable command timeout interrupt. 0: Disable 1: Enable
3	DATATO	R/W	Data timeout interrupt enable Enable/Disable data timeout interrupt. 0: Disable 1: Enable
4	TXURER	R/W	Tx FIFO Underrun Error Interrupt Enable Enable/Disable transmit FIFO underrun error interrupt. 0: Disable 1: Enable

Field	Name	R/W	Description
5	RXORER	R/W	Rx FIFO Overrun Error Interrupt Enable Enable/Disable receive FIFO overrun error interrupt. 0: Disable 1: Enable
6	CMDRESRC	R/W	Command Response Received Interrupt Enable Enable/Disable receiving response interrupt. 0: Disable 1: Enable
7	CMDSENT	R/W	Command Sent Interrupt Enable Enable/Disable command sent interrupt since the software has set/cleared this bit. 0: Disable 1: Enable
8	DATAEND	R/W	Data End Interrupt Enable Enable/Disable data transmission end interrupt. 0: Disable 1: Enable
9	STRTER	R/W	Start Bit Error Interrupt Enable Enable/Disable start bit error interrupt. 0: Disable 1: Enable
10	DBEND	R/W	Data Block End Interrupt Enable Enable/Disable data block transmission end interrupt. 0: Disable 1: Enable
11	CMDACT	R/W	Command Acting Interrupt Enable Enable/Disable transmitting command interrupt. 0: Disable 1: Enable
12	TXACT	R/W	Data Transmit Acting Interrupt Enable Enable/Disable transmitting data interrupt. 0: Disable 1: Enable
13	RXACT	R/W	Data receive acting interrupt enable Enable/Disable receiving data interrupt. 0: Disable 1: Enable
14	TXHFERT	R/W	Tx FIFO Half Empty Interrupt Enable Enable/Disable transmit FIFO half empty interrupt. 0: Disable 1: Enable
15	RXHFFUL	R/W	Rx FIFO Half Full Interrupt Enable Enable/Disable receive FIFO half full interrupt. 0: Disable 1: Enable

Field	Name	R/W	Description
16	TXFUL	R/W	Tx FIFO Full Interrupt Enable Enable/Disable transmit FIFO full interrupt. 0: Disable 1: Enable
17	RXFUL	R/W	Rx FIFO Full Interrupt Enable Enable/Disable receive FIFO full interrupt. 0: Disable 1: Enable
18	TXEPT	R/W	Tx FIFO Empty Interrupt Enable Enable/Disable transmit FIFO empty interrupt. 0: Disable 1: Enable
19	RXFEIE	R/W	Rx FIFO Empty Interrupt Enable Enable/Disable receive FIFO empty interrupt. 0: Disable 1: Enable
20	TXDAVB	R/W	Data Available in Tx FIFO Interrupt Enable Enable/Disable transmit FIFO data available interrupt. 0: Disable 1: Enable
21	RXDAVB	R/W	Data Available in Rx FIFO Interrupt Enable Enable/Disable receive FIFO data available interrupt. 0: Disable 1: Enable
22	SDIOINTREC	R/W	SDIO Mode Interrupt Received Interrupt Enable Enable/Disable SDIO mode interrupt received. 0: Disable 1: Enable
23	ATACLPREC	R/W	CE-ATA Command Completion Signal Received Interrupt Enable Enable/Disable receiving CE-ATA command completion signal interrupt. 0: Disable 1: Enable
31:24	Reserved		

25.6.14 SDIO FIFO counter register (SDIO_FIFOCNT)

Offset address: 0x48

Reset value: 0x0000 0000

Field	Name	R/W	Description
23:0	FIFOCNT	R	Receive And Transmit FIFO Number The number of data words to be written into FIFO or read out from FIFO. Note: If the data length is not a multiple of 4, the last remaining bytes can be treated as one word.
31:24	Reserved		

25.6.15 SDIO data FIFO register (SDIO_FIFODATA)

Offset address: 0x80

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	DATA	R/W	Receive And Transmit FIFO Data Data to be written into FIFO or read out from FIFO.

26 USB_OTG

26.1 Introduction

This chip is embedded with three USB controllers in total.

OTG_FS

OTG_FS can support both host and slave functions to comply with the On-The-Go supplementary standard of USB 2.0 specification, and can also be configured as "Host only" or "Slave only" mode, to fully comply with USB 2.0 specification, and support host negotiation protocol (HNP) and session request protocol (SRP). In host mode, it support full-speed (FS, 12Mb/s) and low-speed (LS, 1.5Mb/s) transmission, and in slave mode, it only supports full-speed (FS, 12Mb/s) transmission.

OTG_HS1

OTG_HS1 can support both host and slave functions to comply with the On-The-Go supplementary standard of USB 2.0 specification, and can also be configured as "Host only" or "Host only" mode, to fully comply with USB 2.0 specification, and support host negotiation protocol (HNP) and session request protocol (SRP). In host mode, it supports high-speed (HS, 480Mb/s), full-speed (FS, 12Mb/s), and low-speed (LS, 1.5Mb/s) transmission and in slave mode, it only supports high-speed (HS, 480Mb/s) and full-speed (FS, 12Mb/s) transmission.

OTG_HS2

OTG_HS2 can support both host and slave functions to comply with the On-The-Go supplementary standard of USB 2.0 specification, and can also be configured as "Host only" or "Host only" mode, to fully comply with USB 2.0 specification, and support high-speed (HS, 480Mb/s), full-speed (FS, 12Mb/s) and low-speed (LS, 1.5Mb/s) transmission, self-test mode defined by USB 2.0 specification, FS/LS serial mode, and 12MHz external crystal clock input.

26.2 OTG_FS global register address mapping

Table 130 OTG_FS Global Register Address Mapping

Register name	Description	Offset address
OTG_FS_GCTRLSTS	Full-speed OTG control state register	0x00
OTG_FS_GINT	Full-speed OTG interrupt register	0x04
OTG_FS_GAHBCFG	Full-speed OTG AHB configuration register	0x08
OTG_FS_GUSBCFG	Full-speed OTG USB configuration register	0x0C

Register name	Description	Offset address
OTG_FS_GRSTCTRL	Full-speed OTG reset control register	0x10
OTG_FS_GCINT	Full-speed OTG module interrupt register	0x14
OTG_FS_GINTMASK	Full-speed OTG module interrupt mask register	0x18
OTG_FS_GRXSTS	Full-speed OTG read debug receive state register	0x1C
OTG_FS_GRXSTSP	Full-speed OTG state read and pop register	0x20
OTG_FS_GRXFIFO	Full-speed OTG receive FIFO size register	0x24
OTG_FS_GTXFCFG	Full-speed OTG TXFIFIO configuration register	0x28
OTG_FS_GNPTXFQSTS	Full-speed OTG non-periodic TXFIFIO queue state register	0x2C
OTG_FS_GGCCFG	Full-speed OTG general module configuration register	0x38
OTG_FS_GCID	Full-speed OTG module ID register	0x3C
OTG_FS_GHPTXFSIZE	Full-speed OTG host periodic TXFIFO size register	0x100
OTG_FS_DTXFIFO1	Full-speed OTG device IN endpoint TXFIFO size register 1	0x104
OTG_FS_DTXFIFO2	Full-speed OTG device IN endpoint TXFIFO size register 2	0x108
OTG_FS_DTXFIFO3	Full-speed OTG device In endpoint TXFIFO size register 3	0x10C

26.3 OTG_FS global register functional description

26.3.1 Full-speed OTG control state register (OTG_FS_GCTRLSTS)

Offset address: 0x00

Reset value: 0x0000 0800

Field	Name	R/W	Description
0	SREQSUC	R	Session Request Success 0: Session request fails 1: Session request succeeds Note: It can be used only in device mode
1	SREQ	R/W	Session Request 0: No request session 1: Request session When HNSUCCHG bit of OTG_FS_GINT register is set, this bit will be cleared by writing 0. This bit will be cleared to 0 when HNSUCCHG is cleared to 0. When USB 1.1 full-speed serial transceiver interface is used for session request, wait for V _{BUS} to discharge to 0.2 V after the BSVD bit of the register is cleared to 0. The discharge time may be different according to different PHY.

Field	Name	R/W	Description
			Note: It can be used only in device mode
7:2	Reserved		
8	HNSUC	R	Host Negotiation Success This bit will be cleared to 0 when HNPREQ of this register is set to 1 0: Host negotiation fails 1: Host negotiation succeeds Note: It can be used only in device mode
9	HNPREQ	R/W	Host Negotiation Protocol Request (HNP Request) 0: Not transmit HNP request 1: Transmit HNP request When HNSUCCHG bit of OTG_FS_GINT register is set, this bit will be cleared by writing 0. This bit will be cleared to 0 when HNSUCCHG is cleared to 0. Note: It can be used only in device mode
10	HHNPEN	R/W	Host Set HNP Enable 0: Disable 1: Enable Note: It can be used only in master mode
11	DHNPEN	R/W	Device HNP Enable 0: Disable 1: Enable Note: It can be used only in device mode
15:12	Reserved		
16	CIDSTS	R	Connector ID Status 0: OTG_FS controller is in Device A mode 1: OTG_FS controller is in Device B mode Note: It can be used in both device and master modes
17	LSDEBT	R	Long/Short Debounce Time Indicate the detected debounce time. The long debounce time is used for physical connection, and the short debounce time is used for software (program) connection. 0: Long debounce time (100ms+2.5 μ s) 1: Short debounce time (2.5 μ S) Note: It can be used only in master mode
18	ASVD	R	A-Session Valid 0: Invalid 1: Valid Note: It can be accessed only in master mode
19	BSVD	R	B-Session Valid In OTG mode, this bit is used to confirm whether the device is in connected status. 0: Invalid 1: Valid Note: It can be accessed only in device mode
31:20	Reserved		

26.3.2 Full-speed OTG interrupt register (OTG_FS_GINT)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
1:0	Reserved		
2	SEFLG	RC_W1	Session End Flag When $V_{BUS} < 0.8V$, it means that V_{BUS} is not used for B-session, and this bit will be set to 1.
7:3	Reserved		
8	SREQSUCCHG	RC_W1	Session Request Success Bit Change If the value of SREQSUC bit changes, this bit will be set to 1.
9	HNSUCCHG	RC_W1	Host Negotiation Success Bit Change If the value of HNSUC bit changes, this bit will be set to 1.
16:10	Reserved		
17	HNFLG	RC_W1	Host Negotiation Flag When USB host negotiation request is detected, this bit will be set to 1.
18	ADTOFLG	RC_W1	A-Device Timeout Flag If this bit is set to 1, it indicates timeout when A-device is waiting for B-device to connect.
19	DEBDFLG	RC_W1	Debounce Done Flag When the equipment is connected and debounce is completed, this bit shall be set to 1; when an interrupt is generated, the USB will be reset. This bit is valid only when HNPEN and SRPEN bits of OTG_FS_GUSBCFG register are set to 1. Note: It can be accessed only in master mode
31:20	Reserved		

26.3.3 Full-speed OTG AHB configuration register (OTG_FS_GAHBCFG)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	GINTMASK	R/W	Global Interrupt Mask 0: Mask global interrupt 1: Unmask global interrupt
6:1	Reserved		
7	TXFEL	R/W	TXFIFO Empty Level In device mode: 0: TXFE interrupt means that IN endpoint TXFIFIO is half-empty 1: TXFE interrupt means that IN endpoint TXFIFIO is all-empty In master mode: 0: NPTXFEM interrupt means that non-periodic TXFIFO is half-empty 1: NPTXFEM interrupt means that non-periodic TXFIFO is all-empty

Field	Name	R/W	Description
8	PTXFEL	R/W	Periodic TXFIFO Empty Level 0: PTXFE interrupt means that periodic TXFIFIO is half-empty 1: PTXFE interrupt means that periodic TXFIFIO is all-empty Note: It can be accessed only in master mode
31:9	Reserved		

26.3.4 Full-speed OTG USB configuration register (OTG_FS_GUSBCFG)

Offset address: 0x0C

Reset value: 0x0000 0A00

Field	Name	R/W	Description
2:0	SEFLG	R/W	FS Timeout Calibrate The additional delay of PHY includes the number of PHY clocks and FS timeout interval. The status of data line may be different for different PHY.. The timeout value of OTG_FS is 16~18-bit time.
5:3	Reserved		
6	FSSTSEL	W	Full-Speed Serial Transceiver Select 0: USB2.0 full-speed ULPI PHY 1: USB1.1 full-speed serial transceiver This bit is always 1.
7	Reserved		
8	SRPEN	R/W	SRP Enable 0: Disable 1: Enable If the SRP function is disabled, connecting the device cannot be requested to activate V _{BUS} and the session cannot be started.
9	HNPEN	R/W	HNP Enable 0: Disable 1: Enable
13:10	TRTIM	R/W	USB Turnaround Time $f_{PHYCLK}=48MHz$, in f_{PHYCLK} . $TRTIM=4 \times f_{AHBCLK} + f_{PHYCLK}$ Example: When $f_{AHBCLK}=72MHz$, TRTIM will be set to 7.
28:14	Reserved		
29	FHMODE	R/W	Forced Host Mode 0: Normal mode 1: Master mode
30	FDMODE	R/W	Forced Device Mode 0: Normal mode 1: Device mode
31	CTXP	R/W	Corrupt TX Packet Debug bit, which cannot be set to 1 Note: It can be accessed in both device and master mode

26.3.5 Full-speed OTG reset register (OTG_FS_GRSTCTRL)

Offset address: 0x10

Reset value: 0x2000 0000

Field	Name	R/W	Description
0	CSRST	R/S	<p>Core Soft Reset</p> <p>This bit controls HCLK and PCLK reset</p> <p>Clear each interrupt and all control state register bits to 0 except the followings:</p> <ul style="list-style-type: none"> - GCLK bit in OTG_FS_PCGCTRL - PCLKSTOP bit in OTG_FS_PCGCTRL - PHYCLKSEL bit in OTG_FS_HCFG - DSPDSEL bit in OTG_FS_DCFG <p>Reset the AHB slave to the idle state and clear TXFIFO and RXFIFO. When the AHB transmission ends, all transactions of AHB shall be terminated as soon as possible and all transactions on USB shall be terminated immediately.</p> <p>Software reset is used generally in either of the following situations:</p> <ul style="list-style-type: none"> ● Software development period. ● After the user dynamically changes the PHY selection bit in the USB configuration register listed above. When the user changes the PHY, the corresponding clock will be selected for the PHY and used in the PHY domain. Once a new clock is selected, the PHY domain must be reset so as to ensure normal operation.
1	HSRST	R/S	<p>HCLK Soft Reset</p> <p>This bit is used to refresh the control logic of AHB clock domain.</p> <p>When clearing this interrupt, the corresponding mask interrupt state control bit shall be cleared; when the interrupt state bit is not cleared to zero, the event state after this bit is set to 1 can be read.</p>
2	HFCNTRST	R/S	<p>Host Frame Counter Reset</p> <p>Reset the frame counter in the host by writing this bit, and the SOF frame number transmitted subsequently is 0.</p> <p>Note: It can be accessed only in master mode.</p>
3	Reserved		
4	RXFFLU	R/S	<p>RXFIFO Flush</p> <p>This bit is used to refresh the whole RXFIFO. Before writing to this bit, it is required to ensure that the module does not perform read and write operation to RXFIFO.</p> <p>Only after this bit is cleared to 0, can other operations be performed (usually need to wait for 8 clock cycles).</p>
5	TXFFLU	R/S	<p>TXFIFO Flush</p> <p>This bit is used to refresh one or the whole TXFIFO. Before writing to this bit, it is required to ensure that the module does not perform read and write operation to TXFIFO.</p>
10:6	TXFNUM	R/W	<p>TXFIFO Number</p> <p>Refresh the FIFO number with TXFIFO refresh bits, and these bits can only be changed after the refresh TXFFIO is cleared to 0.</p> <p>In master mode:</p> <p>00000: Refresh non-periodic TXFIFO</p>

Field	Name	R/W	Description
			00001: Refresh periodic TXFIFO 10000: Refresh all TXFIFO In device mode: 00000: Refresh TXFIFO 0 00001: Refresh TXFIFO 1 00101: Refresh TXFIFO 15 10000: Refresh all TXFIFO
30:11	Reserved		
31	AHBMIDL	R	AHB Master Idle This bit indicates whether the AHB master device is idle.

26.3.6 Full-speed OTG module interrupt register (OTG_FS_GCINT)

Offset address: 0x14

Reset value: 0x0400 0020

In order to avoid generating interrupts before initialization, the software must clear this register to zero before enabling the interrupt bit.

Field	Name	R/W	Description
0	CURMOSEL	R	Current Mode of Operation Select 0: Device mode 1: Master mode
1	MMIS	RC_W1	Mode Mismatch Interrupt This bit will be set to 1 when accessing the following registers: <ul style="list-style-type: none"> ● Access the master mode register in device mode ● Access the device mode register in master mode
2	OTG	R	OTG Interrupt When this bit is set to 1, it indicates that an OTG protocol event has occurred. By reading OTG_FS_GINT register, determine the event that causes the OTG interrupt. This bit can be cleared to zero only after the corresponding bit of the register is cleared.
3	SOF	RC_W1	Start of Frame Interrupt When this bit is set: <ul style="list-style-type: none"> ● In master mode, it indicates that USB has transmitted one SOF (FS) or Keep-Alive (LS); ● In device mode, it indicates that USB has received one SOF, and the current frame number can be obtained by reading the device state register. An interrupt will be generated only when running in FS mode.
4	RXFNONE	R	RXFIFO Non-empty Interrupt This bit indicates that there are still packets in RXFIFO that have not been read.
5	NPTXFEM	R	Non-periodic TXFIFO Empty Interrupt This interrupt will be triggered when the non-periodic TXFIFO is not empty and there is space for writable entries in the request queue. Note: It can be accessed only in master mode

Field	Name	R/W	Description
6	GINNPNAKE	R	Global IN Non-periodic NAK Effective Interrupt This bit indicates that GINAKSET bit of OTG_FS_DCTRL register is valid; this bit can be cleared by clearing GINAKCLR bit of OTG_FS_DCTRL register. As the priority of STALL is higher than that of NAK bit, generation of this interrupt cannot mean that USB has sent NAK signal. Note: It can be accessed only in device mode
7	GONAKE	R	Global OUT NAK Effective Interrupt This bit indicates that GONAKSET bit of OTG_FS_DCTRL register is valid; this bit can be cleared by clearing GONALCLR bit of OTG_FS_DCTRL. Note: It can be accessed only in device mode
9:8	Reserved		
10	ESUS	RC_W1	Early Suspend Interrupt When USB has been idle for 3ms, this bit will be set to 1. Note: It can be accessed only in device mode
11	USBSUS	RC_W1	USB Suspend Interrupt When USB suspending is detected, this bit will be set to 1; when USB has been idle for 3ms, it will enter pending state. Note: It can be accessed only in device mode
12	USBRST	RC_W1	USB Reset Interrupt This bit will be set to 1 when reset is detected on USB. Note: It can be accessed only in device mode
13	ENUMD	RC_W1	Enumeration Done Interrupt This bit will be set to 1 when speed enumeration is completed. Note: It can be accessed only in device mode
14	ISOPD	RC_W1	Isochronous OUT Packet Dropped Interrupt When the RXFIFO space is insufficient and the module cannot write synchronous OUT data packet to RXFIFO, this bit will be set to 1. Note: It can be accessed only in device mode
15	EOPF	RC_W1	End of Periodic Frame Interrupt This bit indicates that the current frame has reached the period specified by PFITV bit of OTG_FS_DCFG register. Note: It can be accessed only in device mode
17:16	Reserved		
18	INEP	R	IN Endpoint Interrupt This bit will be set to 1 when a pending interrupt occurs to one IN endpoint Determine the number of IN endpoint to which an interrupt occurs by reading OTG_FS_DAEPINT register, and determine the causes of the interrupt by reading OTG_FS_DIEPINTx register. To clear this bit, first clear the corresponding state bit of OTG_FS_DIEPINTx register. Note: It can be accessed only in device mode

Field	Name	R/W	Description
19	ONEP	R	<p>OUT Endpoint Interrupt</p> <p>This bit will be set to 1 when a pending interrupt occurs to one OUT endpoint</p> <p>Determine the number of OUT endpoint to which an interrupt occurs by reading OTG_FS_DAEPINT register, and determine the causes of the interrupt by reading OTG_FS_DOEPINTx register.</p> <p>To clear this bit, first clear the corresponding state bit of OTG_FS_DOEPINTx register.</p> <p>Note: It can be accessed only in device mode</p>
20	IIINTX	RC_W1	<p>Incomplete Isochronous IN Transfer Interrupt</p> <p>This bit will be set to 1 when the transmission on at least one synchronous IN endpoint in the current frame is not completed.</p> <p>This interrupt is triggered at the same time with EOPF.</p> <p>Note: It can be accessed only in device mode</p>
21	IP_OUTTX	RC_W1	<p>Incomplete Periodic Transfer Interrupt</p> <p>When this bit is set to 1, the interrupts indicated by it are different in different modes.</p> <p>In the master mode, if the periodic transaction scheduled to be completed in the current frame is still pending (i.e. incomplete), the incomplete periodic transmission interrupt will be triggered.</p> <p>In device mode, when the transmission on at least one synchronous OUT endpoint in the current frame is not completed, interrupt of incomplete OUT synchronous transmission will be triggered, and this interrupt will be triggered at the same time with EOPF.</p>
23:22	Reserved		
24	HPORT	R	<p>Host Port Interrupt</p> <p>This bit will be set to 1 when the state of full-speed OTG controller port changes in master mode.</p> <p>Note: It can be accessed only in master mode</p>
25	HCHAN	R	<p>Host Channels Interrupt</p> <p>This bit will be set to 1 when a suspended interrupt is generated on host channel.</p> <p>Note: It can be accessed only in master mode</p>
26	PTXFE	R	<p>Periodic TXFIFO Empty Interrupt</p> <p>This interrupt will be triggered when the periodic TXFIFO is empty and there is space for writable entries in the request queue. Note: It can be accessed only in master mode</p>
27	Reserved		
28	CINSTSCHG	RC_W1	<p>Connector ID Status Change Interrupt</p> <p>This bit will be set to 1 when the state of connector ID line changes.</p> <p>Note: It can be accessed in both master and device mode</p>
29	DEDIS	RC_W1	<p>Device Disconnect Interrupt</p> <p>This bit will be set to 1 when device disconnection is detected.</p> <p>Note: It can be accessed only in master mode</p>

Field	Name	R/W	Description
30	SREQ	RC_W1	Session Request/New Session Interrupt In different modes, the conditions for triggering this interrupt are: <ul style="list-style-type: none"> ● Session request is detected in master mode ● In device mode, V_{BUS} is within the range of B-device
31	RWAKE	RC_W1	Resume/Remote Wakeup Interrupt In different modes, the conditions for triggering this interrupt are: <ul style="list-style-type: none"> ● Remote wakeup signal is detected on USB in master mode ● Resume signal is detected on USB bus in device mode

26.3.7 Full-speed OTG module interrupt mask register (OTG_FS_GINTMASK)

Offset address: 0x18

Reset value: 0x0000 0000

This register is used to mask the interrupt, but the corresponding bit of the interrupt register will still be set to 1.

Field	Name	R/W	Description
0	Reserved		
1	MMISM	R/W	Mode Mismatch Interrupt Mask 0: Mask 1: Not mask
2	OTGM	R/W	OTG Interrupt Mask 0: Mask 1: Not mask
3	SOFM	R/W	Frame Start Interrupt Mask 0: Mask 1: Not mask
4	RXFNONEM	R/W	RXFIFO Nonempty Interrupt Mask 0: Mask 1: Not mask
5	NPTXFEMM	R/W	Nonperiodic TXFIFO Empty Interrupt Mask 0: Mask 1: Not mask Note: It can be accessed only in master mode
6	GINNPNAKEM	R/W	Global IN Nonperiodic NAK Effective Interrupt Make 0: Mask 1: Not mask Note: It can be accessed only in device mode
7	GONAKEM	R/W	Global OUT NAK Effective Interrupt Mask 0: Mask 1: Not mask Note: It can be accessed only in device mode
9:8	Reserved		
10	ESUSM	R/W	Early Suspend Interrupt Mask 0: Mask

Field	Name	R/W	Description
			1: Not mask Note: It can be accessed only in device mode
11	USBSUSM	R/W	USB Suspend Interrupt Mask 0: Mask 1: Not mask Note: It can be accessed only in device mode

26.3.8 Full-speed OTG read debug receive state register/full-speed OTG state read and pop register (OTG_FS_GRXSTS/OTG_FS_GRXSTSP)

Read offset address: 0x1C

Pop offset address: 0x20

Reset value: 0x0000 0000

Master mode

Field	Name	R/W	Description
3:0	CHNUM	R	Channel Number This bit indicates the received data is transmitted by which channel.
14:4	BCNT	R	Byte Count This bit indicates the byte count of received IN data packet.

Field	Name	R/W	Description
16:15	DPID	R	Data Packet ID This bit indicates the received data packet ID (PID) 00: DATA0 10: DATA1 01: DATA2 11: MDATA
20:17	PSTS	R	Packet Status This bit indicates the status of the received data packet. 0010: Received IN data packet 0011: IN transmission completed 0101: Data synchronization error 0111: Channel stop Others: Reserved
31:21	Reserved		

Device mode

Field	Name	R/W	Description
3:0	EPNUM	R	Endpoint Number This bit indicates the received data is transmitted by which endpoint.
14:4	BCNT	R	Byte Count This bit indicates the byte count of received data packet
16:15	DPID	R	Data PID This bit indicates the received data packet ID (PID) 00: DATA0 10: DATA1 01: DATA2 11: MDATA
20:17	PSTS	R	Packet Status This bit indicates the status of received data packet 0001: Global OUT NAK 0010: Received OUT data packet 0011: OUT transmission completed 0100: SETUP event completed 0110: Received SETUP data packet Others: Reserved
24:21	FNUM	R	Frame Number These bits are valid when synchronous OUT endpoint is supported. These bits are the 4 least significant bits of the packet frame number received on the USB
31:25	Reserved		

26.3.9 Full-speed OTG receive FIFO size register (OTG_FS_GRXFIFO)

Offset address: 0x24

Reset value: 0x0000 0200

Field	Name	R/W	Description
15:0	RXFDEP	R/W	RXFIFO Depth RXFIFO is in word, and the depth range is: 16~256.
31:16	Reserved		

26.3.10 Full-speed OTG TXFIFO configuration register (OTG_FS_GTXFCFG)

Offset address: 0x28

Reset value: 0x0000 0200

Master mode

Field	Name	R/W	Description
15:0	NPTXSA	R/W	Nonperiodic TXFIFO RAM Start Address This bit indicates the start address of non-periodic TXFIFO RAM.
31:16	NPTXFDEP	R/W	Nonperiodic TXFIFO Depth TXFIFO is in word, and the depth range is: 16~256.

Device mode

Field	Name	R/W	Description
15:0	EPTXSA	R/W	Endpoint0 TXFIFO RAM Start Address This bit indicates the start address of TXFIFO RAM of endpoint 0.
31:16	EPTXFDEP	R/W	Endpoint0 TXFIFO Depth TXFIFO is in word, and the depth range is: 16~256.

26.3.11 Full-speed OTG non-periodic TXFIFO queue state register (OTG_FS_GNPTXFQSTS)

Offset address: 0x2C

Reset value: 0x0008 0200

Field	Name	R/W	Description
15:0	NPTXFSA	R	Nonperiodic TXFFIO Space Available These bits indicate the size of available space of non-periodic TXFIFO. (In 32-bit words) 0x0: Non-periodic TXFIFO is full 0x1: 1 word 0x2: 2 words 0xn: n words are available (0≤n≤256) Others: Reserved
23:16	NPTXRSA	R	Non-periodic Transmit Request Space Available This bit indicates the available space size of non-periodic transmit request queue. In master mode: Save IN and OUT requests In device mode: There is only IN request 0x0: The queue is full 0x0: 1 position 0x2: 2 positions

Field	Name	R/W	Description
		 0xn: n positions are available (0≤n≤8) Others: Reserved
30:24	NPTXRQ	R	Nonperiodic Transmit Request Queue Bit 24: Terminate (last data selected for channel/endpoint) Bit [26:25]: 00: IN/OUT token 01: The transmit data packet length is 0 (IN in device mode/OUT in master mode) 10: PING/CPLIT token 11: Stop channel instruction Bit [30:27]: Channel/endpoint number
31	Reserved		

26.3.12 Full-speed OTG general module configuration register (OTG_FS_GGCCFG)

Offset address: 0x38

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	Reserved		
16	PWEN	R/W	Power Down Enable This bit is used to activate the transceiver. 0: Power down is activated 1: Power down inactivated (activate the transceiver)
17	Reserved		
18	ADVBSSEN	R/W	A Device V _{BUS} Sensing Enable 0: Disable 1: Enable
19	BDVBSSEN	R/W	B Device V _{BUS} Sensing Enable 0: Disable 1: Enable
20	SOFPOUT	R/W	SOF Pulse Available on PAD Output This bit selects whether SOF pulse can be output from PAD. 0: No 1: Yes
21	VBSDIS	R/W	V _{BUS} Sensing Disable 0: Enable V _{BUS} sensing 1: Disable V _{BUS} sensing
31:22	Reserved		

26.3.13 Full-speed OTG module ID register (OTG_FS_GCID)

Offset address: 0x3C

Reset value: 0x0000 1100

Field	Name	R/W	Description
31:0	PID	R/W	Product ID Product ID can be programmed by this bit.

26.3.14 Full-speed OTG host periodic TXFIFO size register (OTG_FS_GHPTXFSIZE)

Offset address: 0x100

Reset value: 0x0200 0600

Field	Name	R/W	Description
15:0	HPDXTXFS	R/W	Host Periodic TXFIFO Start Address
31:16	HPDXTXFD	R/W	Host Periodic TXFIFO Depth TXFIFO is in word, and the minimum value is 16.

26.3.15 Full-speed OTG device IN endpoint TXFIFO size register x (OTG_FS_DIEPTXFIFOx) (x=1~3)

Offset address: 0x104+4(x-1)

Reset value: 0x0200 0400

x is FIFO number.

Field	Name	R/W	Description
15:0	INEPTXFRSA	R/W	IN Endpoint TXFIFOx Transmit RAM Start Address These bits indicate the start address of the IN endpoint TXFIFOx RAM and need to be aligned with the 32-bit memory.
31:16	INEPTXFDEP	R/W	IN Endpoint TXFIFO Depth TXFIFO is in word, and the minimum value is 16.

26.4 OTG_FS host mode register address mapping

Table 131 OTG_FS Host Mode Register Address Mapping

Register name	Description	Offset address
OTG_FS_HCFG	Full-speed OTG host configuration register	0x400
OTG_FS_HFIVL	Full-speed OTG host frame interval register	0x404
OTG_FS_HFIFM	Full-speed OTG host frame information register	0x408
OTG_FS_HPTXSTS	Full-speed OTG host periodic transmission state register	0x410
OTG_FS_HACHINT	Full-speed OTG host all-channel interrupt register	0x414
OTG_FS_HACHIMASK	Full-speed OTG host all-channel interrupt mask register	0x418
OTG_FS_HPORTCSTS	Full-speed OTG host port control state register	0x440
OTG_FS_HCHX	Full-speed OTG host channel-X characteristics register (X=0...7)	0x500+20*X
OTG_FS_HCHINTX	Full-speed OTG host channel-X interrupt register (X=0...7)	0x508+20*X

Register name	Description	Offset address
OTG_FS_HCHIMASKX	Full-speed OTG host channel-X interrupt mask register (X=0...7)	0x50C+20*X
OTG_FS_HCHTSIZEX	Full-speed OTG host channel-X transmission size register (X=0...7)	0x510+20*X

26.5 OTG_FS host mode register functional description

26.5.1 Full-speed OTG host configuration register (OTG_FS_HCFG)

Offset address: 0x400

Reset value: 0x0000 0000

Field	Name	R/W	Description
1:0	PHYCLKSEL	R/W	FS/LS PHY Clock Select <ul style="list-style-type: none"> ● In FS mode: <ul style="list-style-type: none"> 01: PHY clock is 48MHz Others: Reserved ● In LS mode: <ul style="list-style-type: none"> 00: Reserved 01: PHY clock is 48MHz 10: PHY clock is 6MHz 11: Reserved Note: Software reset is required after the value of this bit is changed.
2	FSSPT	R	FS Support After the host is connected to the device, select whether the host follows the maximum speed supported by the device. If this bit is set to 1, even if the device supports HS mode, the host supports FS at most. <ul style="list-style-type: none"> 0: The host can support HS/FS/LS 1: The host only supports FS/LS
31:3	Reserved		

26.5.2 Full-speed OTG host frame interval register (OTG_FS_HFIVL)

Offset address: 0x404

Reset value: 0x0000 EA60

This register can be edited only after the port (PEN bit of OTG_FS_HPORTCSTS register is set to 1) is enabled.

Field	Name	R/W	Description
15:0	FIVL	R/W	Frame Interval This bit is used to control the time interval between two continuous SOF (FS), micro-SOF (HS), and Keep-Alive (LS). Time interval=frame duration×PHY clock
31:16	Reserved		

26.5.3 Full-speed OTG host fframe information register (OTG_FS_HFIFM)

Offset address: 0x408

Reset value: 0x0000 3FFF

Field	Name	R/W	Description
15:0	FNUM	R	Frame Number This bit is used to indicate the current frame number. This bit will be cleared to zero when reaching 0x3FFF.
31:16	FRTIME	R	Frame Remaining Time This bit is used to indicate the current remaining time of frame. The initial value is the value of OTG_FS_HFIVL, and every time passing one PHY clock, the value of this bit will decrease by 1, and when reaching 0, this bit will reload the value of frame interval.

26.5.4 Full-speed OTG host periodic transmission state register (OTG_FS_HPTXSTS)

Offset address: 0x410

Reset value: 0x0008 0100

Field	Name	R/W	Description
15:0	FSPACE	R/W	Periodic Transmit Data FIFO Available Space This bit indicates the idle space of periodic TXFIFO (in 32-bit word). 0x0: TXFIFO is full 0x1: 1 word 0x2: 2 words 0xn: n words are available (0<n<512) Others: Reserved
23:16	QSPACE	R	Periodic Transmit Request Queue Available Space This bit indicates the available space of periodic transmit request queue. 0x0: The queue is full 0x1: 1 position 0x2: 2 positions 0xn: n positions are available (0<n<8) Others: Reserved
31:24	QTOP	R	Top of the Periodic Transmit Request Queue This bit indicates the transaction being processed in periodic transmit request queue. [24]: End [26:25]: Type 00: IN/OUT 01: Zero-length data packet 11: Disable channel command [30:27]: Channel/endpoint number [31]: Odd/even frame 0: Even frame 1: Odd frame

26.5.5 Full-speed OTG host all-channel interrupt register (OTG_FS_HACHINT)

Offset address: 0x414

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	ACHINT	R	All Channels Interrupts No. X bit represents interrupt of Channel X. Up 16 channels.
31:16	Reserved		

26.5.6 Full-speed OTG host all-channel interrupt mask register (OTG_FS_HACHIMASK)

Offset address: 0x418

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	ACHIMASK	R/W	All Channels Interrupts Mask No. X bit represents interrupt mask of Channel X. Up 16 channels. 0: Mask 1: Not mask
31:16	Reserved		

26.5.7 Full-speed OTG host port control state register (OTG_FS_HPORTCSTS)

Offset address: 0x440

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	PCNNTFLG	R	Port Connect Flag 0: The port is not connected 1: Port connected
1	PCINTFLG	RC_W1	Port Connect Interrupt Flag This bit will be set to 1 when the port is connected to the device.
2	PEN	RC_W0	Port Enable After the port resets the sequence, the program cannot write to this bit, and can only enable the port through the module. If this bit is cleared to zero, the port will be disabled. 0: Disable 1: Enable
3	PENCHG	RC_W1	PEN Bit Change This bit will be set to 1 when PEN bit of this register changes.
4	POVC	R	Port Overcurrent This bit indicates whether this port is overloaded. 0: No overload 1: Overload
5	POVCCHG	RC_W1	POVC Bit Change This bit will be set to 1 when POVC bit changes.

Field	Name	R/W	Description
6	PRS	R/W	Port Resume 0: Resume signal is not driven 1: Resume signal is driven
7	PSUS	R/S	Port Suspend 0: Port is not suspended 1: Port is suspended
8	PRST	R/W	Port Reset The prot can start reset only when this bit is set to 1 for over 10ms. 0: Not in reset state 1: In reset state
9	Reserved		
11:10	PDLSTS	R	Port Data Line Status This bit indicates the logic level of the USB data line at this time. [10] bit means OTG_FS_FS_DP [11] bit means OTG_FS_FS_DM
12	PP	R/W	Port Power This bit controls the power-on of the port. If there is overload, the port will power down (clear 0). 0: Power down 1: Power on
16:13	PTSEL	R/W	Port Test Mode Select 0000: Test is disabled 0001: Test_J 0010: Test_K 0011: Test_SE0_NAK 0100: Test_Packet 0101: Test_Force_Enable Others: Reserved
18:17	PSPDSEL	R	Port Speed Select 01: Full speed 10: Low speed 11: Reserved
31:19	Reserved		

26.5.8 Full-speed OTG host channel-X characteristics register (OTG_FS_HCHX) (X=0...7)

Offset address: 0x500+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
10:0	MAXPSIZE	R/W	Maximum Data Packet Size This bit indicates the maximum data packet size of the device endpoint connected to the host.
14:11	EDPNUM	R/W	Endpoint Number

Field	Name	R/W	Description
			This bit indicates the number of the device endpoint connected to the host.
15	EDPDRT	R/W	Endpoint Direction 0: OUT 1: IN
16	Reserved		
17	LSDV	R/W	Low-speed Device This bit indicates the low-speed device is connected.
19:18	EDPTYP	R/W	Endpoint Type This bit is used to select the transmission type of endpoint. 00: Control 01: Synchronous 10: Batch 11: Interrupt
21:20	CNTSEL	R/W	Count Function Select In this register, this bit is only used to indicate the number of transactions that must be executed by the periodic endpoint per frame. 00: Reserved 01: 1 10: 2 11: 3
28:22	DVADDR	R/W	Device Address This bit indicates the device address connected to the host.
29	ODDF	R/W	Odd Frame This bit controls whether the OTG host transmits in odd frame. 0: Even frame 1: Odd frame Note: It applies only to periodic transactions.
30	CHINT	R/S	Channel Interrupt 0: Not interrupt 1: Stop transmitting data through the channel
31	CHEN	R/S	Channel Enable 0: Disable 1: Enable

26.5.9 Full-speed OTG host channel-X interrupt register (OTG_FS_HCHINTX) (X=0...7)

Offset address: 0x508+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPN	RC_W1	Transfer Complete Normally
1	TSFCMPAN	RC_W1	Transfer Complete Abnormally
2	Reserved		

Field	Name	R/W	Description
3	RXSTALL	RC_W1	STALL Response Received Interrupt
4	RXNAK	RC_W1	NAK Response Received Interrupt
5	RXTXACK	RC_W1	ACK Response Received/Transmitted Interrupt
6	Reserved		
7	TERR	RC_W1	Transaction Error Indicate that one of the following error occurs: CRC failure Timeout Bit stuffing error EOP error
8	BABBLE	RC_W1	Babble Error
9	FOVR	RC_W1	Frame Overrun Error
10	DTOG	RC_W1	Data Toggle Error
31:11	Reserved		

26.5.10 Full-speed OTG host channel-X interrupt mask register (OTG_FS_HCHIMASKX) (X=0...7)

Offset address: 0x50C+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPNM	R/W	Transfer Complete Normally Mask 0: Mask 1: Not mask
1	TSFCMPANM	R/W	Transfer Complete Abnormally Mask 0: Mask 1: Not mask
2	Reserved		
3	RXSTALLM	R/W	STALL Response Received Interrupt Mask 0: Mask 1: Not mask
4	RXNAKM	R/W	NAK Response Received Interrupt Mask 0: Mask 1: Not mask
5	RXTXACKM	R/W	ACK Response Received/Transmitted Interrupt 0: Mask 1: Not mask
6	RXNYETM	R/W	NYET Response Received Interrupt Mask 0: Mask 1: Not mask

Field	Name	R/W	Description
7	TERRM	R/W	Transaction Error Mask 0: Mask 1: Not mask
8	BABBLEM	R/W	Babble Error Mask 0: Mask 1: Not mask
9	FOVRM	R/W	Frame Overrun Error Mask 0: Mask 1: Not mask
10	DTOGM	R/W	Data Toggle Error Mask 0: Mask 1: Not mask
31:11	Reserved		

26.5.11 Full-speed OTG host channel-X transmission size register (OTG_FS_HCHTSIZEX) (X=0...7)

Offset address: 0x510+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
18:0	TSFSIZE	R/W	Transfer Size <ul style="list-style-type: none"> For IN: The value of this bit is the size reserved for the transmission buffer, which is generally an integer multiple of the maximum data packet. For OUT: The value of this bit determines the number of bytes to be transmitted by the host.
28:19	PCKTCNT	R/W	Packet Count This bit indicates the value of the transmitted or received data packet. For each data packet transmitted, the value of this bit decreases by 1. When it decreases to 0, it means that the transmission is completed.
30:29	DATAPID	R/W	Data PID This bit is initial PID of data communication. 00: DATA0 01: DATA2 10: DATA1 11: MDATA (controlled transmission)/SETUP (uncontrolled transmission)
31	Reserved		

26.6 OTG_FS device mode register address mapping

Table 132 OTG_FS Device Mode Register Address Mapping

Register name	Description	Offset address
OTG_FS_DCFG	Full-speed OTG device configuration register	0x800

Register name	Description	Offset address
OTG_FS_DCTRL	Full-speed OTG device control register	0x804
OTG_FS_DSTS	Full-speed OTG device state register	0x808
OTG_FS_DINIMASK	Full-speed OTG device IN endpoint interrupt mask register	0x810
OTG_FS_DOUTIMASK	Full-speed OTG device OUT endpoint interrupt mask register	0x814
OTG_FS_DAEPINT	Full-speed OTG device all-endpoint interrupt register	0x818
OTG_FS_DAEPIMASK	Full-speed OTG device all-endpoint interrupt mask register	0x81C
OTG_FS_DVBUSDTIM	Full-speed OTG device VBUS release time register	0x828
OTG_FS_DVBUSPTIM	Full-speed OTG device VBUS pulse time register	0x82C
OTG_FS_DIEIMASK	Full-speed OTG device IN endpoint FIFO empty interrupt mask register	0x834
OTG_FS_DIEPCTRL0	Full-speed OTG device IN endpoint 0 control register	0x900
OTG_FS_DIEPCTRLx	Full-speed OTG device IN endpoint x control register	0x900+20x
OTG_FS_DIEPINTx	Full-speed OTG device IN endpoint x interrupt register (x=0...3)	0x908+20x
OTG_FS_DIEPTRS0	Full-speed OTG device IN endpoint 0 transmission size register	0x910
OTG_FS_DIEPTRSx	Full-speed OTG device IN endpoint x transmission size register (x=1...3)	0x910+20x
OTG_FS_DITXFSTSx	Full-speed OTG device IN endpoint x TXFIFO state register (x=0...3)	0x918+20x
OTG_FS_DOEPCTRL0	Full-speed OTG device OUT endpoint 0 control register	0xB00
OTG_FS_DOEPCTRLx	Full-speed OTG device OUT endpoint x control register (x=1...3)	0xB00+20x
OTG_FS_DOEPINTx	Full-speed OTG device OUT endpoint x interrupt register (x=0...3)	0xB08+20x
OTG_FS_DOEPTRS0	Full-speed OTG device OUT endpoint 0 transmission size register	0xB10
OTG_FS_DOEPTRSx	Full-speed OTG device OUT endpoint x transmission size register (x=1...3)	0xB10+20x

26.7 OTG_FS device mode register functional description

26.7.1 Full-speed OTG device configuration register (OTG_FS_DCFG)

Offset address: 0x800

Reset value: 0x0220 0000

Field	Name	R/W	Description
1:0	DSPDSEL	R/W	Device Speed Select This bit selects the maximum enumeration speed of the device connected to the host, 11: FS (48MHz) Others: Reserved
2	SENDOUT	R/W	Transmit the Received OUT Packet on Nonzero-length Status 0: After receiving the OUT data packet, transmit the data packet to the application program, and reply the handshake signal according to the NAK and STALL bits of the endpoint 1: After receiving the OUT data packet (non-zero length), reply the STALL handshake signal
3	Reserved		
10:4	DADDR	R/W	Device Address This bit is the address of storage device, and the parameters are from SetAddress command.
12:11	PFITV	R/W	Periodic (Micro) Frame Interval This bit is configured to determine the time point of the periodic frame interrupt program, and can determine whether the synchronous communication of the frame is completed. 00: 80% of frame interval 01: 85% of frame interval 10: 90% of frame interval 11: 95% of frame interval
31:13	Reserved		

26.7.2 Full-speed OTG device control register (OTG_FS_DCTRL)

Offset address: 0x804

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	RWKUPS	R/W	Remote Wakeup Signaling The program wakes up the USB host by setting this bit to 1 to make the module exit the suspended state. Note: According to the agreement, after this bit is set to 1, it should be cleared to 0 within 1~15ms.
1	SDCNNT	R/W	Soft Disconnect Soft disconnect means that the host cannot receive the signal of "Device connected", and the device cannot receive the signal. 0: Normal. The host can receive device connection event 1: Soft disconnection
2	GINAKSTS	R	Global IN NAK Status This bit determines whether to reply the handshake signal according to the data availability in TXFIFO. 0: Yes 1: No, all non-periodic IN endpoints reply handshake signal

Field	Name	R/W	Description
3	GONAKSTS	R	Global OUT NAK Status 0: Transmit the handshake signal according to FIFO state and NAK and STALL bit state 1: No data is received, and all data packets except the SETUP transaction reply the NAK signal
6:4	TESTSEL	R/W	Test Mode Select 000: Disable the test 001: Test_J 010: Test_K 011: Test_SE0_NAK 100: Test_Packet 101: Test_Force_Enable Others: Reserved
7	GINAKSET	W	Global IN NAK Setup Set the global non-periodic IN NAK to 1 to make the non-periodic IN endpoint transmit NAK signal. This bit can be set to 1 only when GINNPNAKE bit of OTG_FS_GCINT register is cleared to 0.
8	GINAKCLR	W	Global IN NAK Clear Clear the global non-periodic IN NAK to 0.
9	GONAKSET	W	Global OUT NAK Setup Set the global OUT NAK to 1 to make OUT endpoint transmit NAK signal. This bit can be set to 1 only when GONAKE bit of OTG_FS_GCINT register is cleared to 0.
10	GONAKCLR	W	Global OUT NAK Clear Clear the global OUT NAK to 0.
11	POPROGCMP	R/W	Power-on Programming Complete This bit indicates that the programming operation is completed after the register is awakened.
31:12	Reserved		

26.7.3 Full-speed OTG device state register (OTG_FS_DSTS)

Offset address: 0x808

Reset value: 0x0000 0010

Field	Name	R/W	Description
0	SUSSTS	R	Suspend Status When the USB bus has been idle for more than 3ms, the module will enter the suspended state, and this bit will be set to 1. When there is an activity on the USB line or the module receives a remote wake-up signal, the module will exit the suspended state.
2:1	ENUMSPD	R	Enumerated Speed Enumeration speed of full-speed OTG after chirp sequence detection. 11: Full speed (48MHz) Others: Reserved

Field	Name	R/W	Description
3	ERTERR	R	Erratic Error If any irregular error occurs, this bit will be set to 1. At this time, communication can be resumed only by performing soft disconnection.
7:4	Reserved		
21:8	SOFNUM	R	Frame Number of the Received SOF
31:22	Reserved		

26.7.4 Full-speed OTG device IN endpoint interrupt mask register (OTG_FS_DINIMASK)

Offset address: 0x810

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPM	R/W	Transfer Completed Interrupt Mask 0: Mask 1: Not mask
1	EPDISM	R/W	Endpoint Disable Interrupt Mask 0: Mask 1: Not mask
2	Reserved		
3	TOM	R/W	Timeout Interrupt Mask 0: Mask 1: Not mask
4	ITXEMPM	R/W	IN Token Received when Tx FIFO Empty Mask 0: Mask 1: Not mask
5	IEPMMM	R/W	IN Token Received with Endpoint Mismatch Mask 0: Mask 1: Not mask
6	IEPNAKEM	R/W	IN Endpoint NAK Effective Mask 0: Mask 1: Not mask
31:7	Reserved		

26.7.5 Full-speed OTG device OUT endpoint interrupt mask register (OTG_FS_DOUTIMASK)

Offset address: 0x814

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPM	R/W	Transfer Completed Interrupt Mask 0: Mask 1: Not mask

Field	Name	R/W	Description
1	EPDISM	R/W	Endpoint Disable Interrupt Mask 0: Mask 1: Not mask
2	Reserved		
3	SETPCMPM	R/W	SETUP Phase Complete Mask 0: Mask 1: Not mask
4	OTXEMPM	R/W	OUT Token Received when Endpoint Disabled Mask 0: Mask 1: Not mask
31:5	Reserved		

26.7.6 Full-speed OTG device all-endpoint interrupt register (OTG_FS_DAEPINT)

Offset address: 0x818

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	INEPINT	R	All IN Endpoint Interrupts No. X bit indicates interrupt of IN endpoint X. Up to 16 IN endpoints.
31:16	OUTEPINT	R	All OUT Endpoint Interrupts No. X bit indicates interrupt of OUT endpoint (X-16). Up to 16 OUT endpoints.

26.7.7 Full-speed OTG device all-endpoint interrupt mask register (OTG_FS_DAEPIMASK)

Offset address: 0x81C

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	AINM	R/W	All IN Endpoint Interrupts Mask No. X bit indicates interrupt mask of IN endpoint X. Up to 16 IN endpoints. 0: Mask 1: Not mask
31:16	AOUTM	R/W	All OUT Endpoint Interrupts Mask No. X bit indicates interrupt mask of OUT endpoint (X-16). Up to 16 OUT endpoints. 0: Mask 1: Not mask

26.7.8 Full-speed OTG device V_{bus} release time register (OTG_FS_DVBUSDTIM)

Offset address: 0x828

Reset value: 0x0000 17D7

Field	Name	R/W	Description
15:0	VBUSDTIM	R/W	Device V _{BUS} Discharge Time Discharge time after V _{BUS} impulses during SRP period. Value=Discharge time (number of PHY clock)/1024
31:16	Reserved		

26.7.9 Full-speed OTG device V_{BUS} pulse time register (OTG_FS_DVBUSPTIM)

Offset address: 0x82C

Reset value: 0x0000 05B8

Field	Name	R/W	Description
11:0	VBUSPTIM	R/W	Device V _{BUS} Pulsing Time V _{BUS} pulse time during SRP. Value=Pulse time (number of PHY clock)/1024
31:12	Reserved		

26.7.10 Full-speed OTG device IN endpoint FIFO empty interrupt mask register (OTG_FS_DIEIMASK)

Offset address: 0x834

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	INEM	R/W	IN Endpoint Tx FIFO Empty Interrupt Mask No. X bit indicates TXFE interrupt mask of IN endpoint X. Up to 16 IN endpoints. 0: Mask 1: Not mask
31:16	Reserved		

26.7.11 Full-speed OTG device IN endpoint 0 control register (OTG_FS_DIEPCTRL0)

Offset address: 0x900

Reset value: 0x0000 0000

Field	Name	R/W	Description
1:0	MAXPS	R/W	Maximum Packet Size This bit configures the maximum data packet size of endpoint. 00: 64 bytes 01: 32 bytes 10: 16 bytes 11: 8 bytes
14:2	Reserved		
15	USBAEP	R	USB Active Endpoint This bit indicates whether the endpoint is activated in the current configuration and interface. This bit is always set to 1.

Field	Name	R/W	Description
16	Reserved		
17	NAKSTS	R	<p>NAK Status</p> <p>0: The module replies non-NAK handshake signal according to the FIFO state</p> <p>1: The module replies the NAK handshake signal on this endpoint. At this time, even if there is space in TXFIFO, the module will still stop transmitting data.</p>
19:18	EPTYPE	R	<p>Endpoint Type</p> <p>This bit is set to 00 by hardware, indicating control type of the endpoint.</p>
20	Reserved		
21	STALLH	R/S	<p>STALL Handshake</p> <p>The program can only set this bit to 1 and when the endpoint receives the SETUP token, this bit will be cleared to 0. The priority of STALL is higher than that of NAK.</p>
25:22	TXFNUM	R/W	<p>TXFIFO Number</p> <p>Set a separate FIFO number for IN endpoint 0.</p>
26	NAKCLR	W	<p>NAK Clear</p> <p>When performing write operation to this bit, the NAK bit of the endpoint 0 will be cleared to 0.</p>
27	NAKSET	W	<p>NAK Set</p> <p>When performing write operation to this bit, the NAK bit will be set to 1.</p>
29:28	Reserved		
30	EPDIS	R	<p>Endpoint Disable</p> <p>Data transmission on the endpoint can be stopped by setting this bit to 1.</p> <p>This bit needs to be cleared to 0 before the endpoint disable interrupt bit is set to 1; this bit can only be set to 1 after EPEN is set to 1.</p>
31	EPEN	R	<p>Endpoint Enable</p> <p>After this bit is set to 1, the endpoint will start to transmit data. When any of the following interrupts is triggered, this bit will be cleared to 0:</p> <ul style="list-style-type: none"> ● SETUP completed ● Disable endpoint ● Transmission completed

26.7.12 Full-speed OTG device IN endpoint x control register (OTG_FS_DIEPCTRLx) (x=1~3, endpoint number)

Offset address: 0x900+0x20x

Reset value: 0x0000 0000

Field	Name	R/W	Description
10:0	MAXPS	R/W	<p>Maximum Packet Size</p> <p>This bit configures the maximum data packet size of endpoint. (in byte).</p>

Field	Name	R/W	Description
14:11	Reserved		
15	USBAEP	R/W	<p>USB Active Endpoint</p> <p>This bit indicates whether the endpoint is activated in the current configuration and interface.</p> <p>After USB is reset, this bit will be cleared to 0 (except endpoint 0).</p>
16	EOF	R	<p>Even Odd Frame</p> <p>This bit is used to indicate the frame number transmitted/received by the endpoint (for synchronization IN) or the PID of data packet (for interrupt/batch IN).</p> <p>Used for synchronous IN endpoints:</p> <p>0: Even frame 1: Odd frame</p> <p>Endpoint Data PID</p> <p>Used for interrupt/batch IN endpoints:</p> <p>0: DATA0 1: DATA1</p>
17	NAKSTS	R	<p>NAK Status</p> <p>0: The module replies non-NAK handshake signal according to the FIFO state</p> <p>1: The module replies to the NAK handshake signal on this endpoint; at this time, for asynchronous IN: even if there is data available in TXFIFO, the module will still stop transmitting data; for synchronous IN, the module will transmit zero-length data packet even if there is data available in TXFIFO</p> <p>Note: The module always responds to the SETUP data packet through ACK handshake.</p>

26.7.13 Full-speed OTG device IN endpoint x interrupt register (OTG_FS_DIEPINTx) (x=0~3, endpoint number)

Offset address: 0x908+0x20x; m=0~3

Reset value: 0x0000 0080

Read this register when ONEP bit of OTG_FS_GCINT register is set to 1;
Read OTG_FS_DAEPINT register to obtain the accurate endpoint number of the device endpoint x interrupt register, and then read the register; only when the corresponding bit of the register is cleared to 0, can the corresponding bit of OTG_FS_DAEPINT register and OTG_FS_GCINT register be cleared to 0.

Field	Name	R/W	Description
0	TSFCMP	RC_W1	<p>Transfer Complete Interrupt</p> <p>This bit indicates that the transmission on the endpoint has been completed.</p>
1	EPDIS	RC_W1	<p>Endpoint Interrupt Disable</p> <p>This bit means that the endpoint is disabled.</p>
2	Reserved		

Field	Name	R/W	Description
3	TO	RC_W1	Timeout Interrupt This bit is only applicable to the control IN endpoints, indicating that the response to the recently received IN token has timed out.
4	ITXEMP	RC_W1	Receive IN Token Interrupt when FIFO is empty This bit is only applicable to non-periodic IN endpoints, indicating that IN token is received when the corresponding TXFIFO of the endpoint is empty.
5	Reserved		
6	IEPNAKE	RC_W1	IN Endpoint NAK Effective This bit indicates that the module samples NAK, namely, the NAK bit of the IN endpoint has taken effect. This bit will be cleared to 0 when NAKCLR bit of OTG_FS_DIEPCTRLx register is written.
7	TXFE	R	TXFIFO Empty Interrupt The interrupt will be generated when TXFIFO of this endpoint is empty.
31:8	Reserved		

26.7.14 Full-speed OTG device IN endpoint 0 transmission size register (OTG_FS_DIEPTRS0)

Offset address: 0x910

Reset value: 0x0000 0000

This register can be modified only after EPEN bit of OTG_FS_DIEPCTRLx register is set to 1; this register can be read only when EPEN bit of OTG_FS_DIEPCTRLx register is cleared to 0

Field	Name	R/W	Description
6:0	EPTRS	R/W	Endpoint Transfer Size This bit indicates the data size contained by endpoint 0 in one data transmission.
18:7	Reserved		
20:19	EPPCNT	R/W	Endpoint Packet Count This bit indicates the number of data packets contained by endpoint 0 in one data transmission.
31:21	Reserved		

26.7.15 Full-speed OTG device IN endpoint x transmission size register (OTG_FS_DIEPTRSx) (x=1~3, endpoint number)

Offset address: 0x910+0x20x; x=1~3

Reset value: 0x0000 0000

This register can be modified only after EPEN bit of OTG_FS_DIEPCTRLx register is set to 1; this register can be read only when EPEN bit of OTG_FS_DIEPCTRLx register is cleared to 0

Field	Name	R/W	Description
18:0	EPTRS	R/W	Endpoint Transfer Size This bit indicates the data size contained by endpoint x in one data transmission (in byte).
28:19	EPPCNT	R/W	Endpoint Packet Count This bit indicates the number of data packets contained by endpoint x in one data transmission.
30:29	TXDCNT	R/W	Transmit Packet Count <ul style="list-style-type: none"> For periodic IN endpoints, this bit indicates the number of data packets that must be transmitted per frame on USB. For the calculation synchronization IN endpoint, this bit calculates the data PID of the endpoint. 01: 1 10: 2 11: 3
31	Reserved		

26.7.16 Full-speed OTG device IN endpoint x TXFIFO state register (OTG_FS_DITXFSTSx) (x=0~3, endpoint number)

Offset address: 0x918+0x20m; m=0~3

Field	Name	R/W	Description
15:0	INEPTXFSA	R	IN Endpoint TXFIFO Space Available This bit indicates the available space of the IN endpoint TXFIFO (in word). 0x0: IN endpoint TXFIFO is full 0x1: 1 byte 0x2: 2 bytes 0xn: n bytes are available (0<n<512) Other value: Reserved
31:16	Reserved		

26.7.17 Full-speed OTG device OUT endpoint 0 control register (OTG_FS_DOEPCTRL0)

Offset address: 0xB00

Reset value: 0x0000 8000

Field	Name	R/W	Description
1:0	MAXPS	R	Maximum Packet Size This bit configures the maximum data packet size of endpoint. 00: 64 bytes 01: 32 bytes 10: 16 bytes 11: 8 bytes
14:2	Reserved		

Field	Name	R/W	Description
15	USBAEP	R	USB Active Endpoint This bit indicates whether the endpoint is activated in the current configuration and interface. This bit is always set to 1.
16	Reserved		
17	NAKSTS	R	NAK Status 0: The module replies non-NAK handshake signal according to the FIFO state 1: The module replies the NAK handshake signal on this endpoint. At this time, even if there is space in RXFIFO, the module will still stop receiving data.
19:18	EPTYPE	R	Endpoint Type This bit is set to 00 by hardware, indicating control type of the endpoint.
20	SNMEN	R/W	Snoop Mode Enable In snoop mode, the correctness of OUT data packets is not checked before they are transmitted to the storage area.
21	STALLH	R/S	STALL Handshake The program can only set this bit to 1 and when the endpoint receives the SETUP token, this bit will be cleared to 0. The priority of STALL is higher than that of NAK.
25:22	Reserved		
26	NAKCLR	W	NAK Clear When performing write operation to this bit, the NAK bit of the endpoint 0 will be cleared to 0.
27	NAKSET	W	NAK Set When performing write operation to this bit, the NAK bit will be set to 1.
29:28	Reserved		
30	EPDIS	R	Endpoint Disable Data transmission on the endpoint can be stopped by setting this bit to 1. This bit needs to be cleared to 0 before the endpoint disable interrupt bit is set to 1; this bit can only be set to 1 after EPEN is set to 1.
31	EPEN	W	Endpoint Enable After this bit is set to 1, the endpoint will start to transmit data. When any of the following interrupts is triggered, this bit will be cleared to 0: <ul style="list-style-type: none"> ● SETUP completed ● Disable endpoint ● Transmission completed

26.7.18 Full-speed OTG device OUT endpoint x control register (OTG_FS_DOEPCTRLx) (x=1~3, endpoint number)

Offset address: 0xB00+0x20x

Reset value: 0x0000 0000

Field	Name	R/W	Description
10:0	MAXPS	R/W	Maximum Packet Size This bit configures the maximum data packet size of endpoint. (in byte).
14:11	Reserved		
15	USBAEP	R/W	USB Active Endpoint This bit indicates whether the endpoint is activated in the current configuration and interface. After USB is reset, this bit will be cleared to 0 (except endpoint 0).
16	EOF	R	Even Odd Frame This bit is used to indicate the frame number transmitted/received by the endpoint (for synchronization IN) or the PID of data packet (for interrupt/batch IN). Used for synchronous IN endpoints: 0: Even frame 1: Odd frame Endpoint Data PID Used for interrupt/batch IN endpoints: 0: DATA0 1: DATA1
17	NAKSTS	R	NAK Status 0: The module replies non-NAK handshake signal according to the FIFO state 1: The module replies the NAK handshake signal on this endpoint. At this time, for OUT endpoint, even if there is remaining space in RXFIFO, the module will still stop receiving data Note: The module always responds to the SETUP data packet through ACK handshake.
19:18	EPTYPE	R/W	Endpoint Type 00: Control 01: Synchronous 10: Batch 11: Interrupt
20	SNMEN	R/W	Snoop Mode Enable In snoop mode, the correctness of OUT data packets is not checked before they are transmitted to the storage area.
21	STALLH	RW/RS	STALL Handshake <ul style="list-style-type: none"> For uncontrolled and non-synchronous IN endpoints (read/write mode is R/W): When this bit is set to 1, the device will reply STALL to all tokens from the USB host. This bit can only be cleared to 0 by software. Used for control endpoints (read/write mode is R/W): When this bit is set to 1, it means that the module receives SETUP token.
25:22	Reserved		

Field	Name	R/W	Description
26	NAKCLR	W	NAK Clear When performing write operation to this bit, the NAK bit of the endpoint will be cleared to 0.
27	NAKSET	W	NAK Set When performing write operation to this bit, the NAK bit of the endpoint will be set to 1. This bit can control the transmission of NAK handshake signal.
28	DPIDSET	W	DATA0 PID Set <ul style="list-style-type: none"> Used for interrupt/batch IN endpoints: When performing write operation to this bit, PID will be set to DATA0. Even Frame Set <ul style="list-style-type: none"> Used for synchronous IN endpoints: When performing write operation to this bit, EOF will be set to even frame.
29	OFSET	W	Odd Frame Set <ul style="list-style-type: none"> Used for synchronous OUT endpoints: When performing write operation to this bit, EOF will be set to odd frame. Used for interrupt/batch OUT endpoints: When performing write operation to this bit, PID will be set to DATA1.
30	EPDIS	R/S	Endpoint Disable Data transmission on the endpoint can be stopped by setting this bit to 1. This bit needs to be cleared to 0 before the endpoint disable interrupt bit is set to 1; this bit can only be set to 1 after EPEN is set to 1.
31	EPEN	R/S	Endpoint Enable After this bit is set to 1, the endpoint will start to transmit data. When any of the following interrupts is triggered, this bit will be cleared to 0: <ul style="list-style-type: none"> SETUP completed Disable endpoint Transmission completed

26.7.19 Full-speed OTG device OUT endpoint x interrupt register (OTG_FS_DOEPINTx) (x=0~3, endpoint number)

Offset address: 0xB08+0x20m; m=0~3

Reset value: 0x0000 0080

Read this register when ONEP bit of OTG_FS_GCINT register is set to 1;

Read OTG_FS_DAEPINTx register to obtain the accurate endpoint number of the device endpoint x interrupt register, and then read the register; only when the corresponding bit of the register is cleared to 0, can the corresponding bit of OTG_FS_DAEPINT register and OTG_FS_GCINT register be cleared to 0.

Field	Name	R/W	Description
0	TSFCMP	RC_W1	Transfer Complete Interrupt This bit indicates that the transmission on the endpoint has been completed.
1	EPDIS	RC_W1	Endpoint Interrupt Disable This bit means that the endpoint is disabled.
2	Reserved		
3	SETPCMP	RC_W1	SETUP Phase Complete Interrupt This bit is only applicable to the control OUT endpoint, indicating that the SETUP phase has been completed. After an interrupt is generated, the received SETUP data can be decoded.
4	RXOTDIS	RC_W1	Receive OUT Token When Disable Interrupt This bit is only applicable to the control OUT endpoint, indicating that the OUT token is received without enabling the endpoint.
5	Reserved		
6	RXBSP	RC_W1	Receive Back-to-Back SETUP Packet Interrupt This bit is only applicable to the control OUT endpoint, indicating that the endpoint has received more than three consecutive SETUP data packets.
31:7	Reserved		

26.7.20 Full-speed OTG device OUT endpoint 0 transmission size register (OTG_FS_DOEPTRS0)

Offset address: 0xB10

Reset value: 0x0000 0000

This register can be modified only after EPEN bit of OTG_FS_DOEPCTRLx register is set to 1; this register can be read only after EPEN bit of OTG_FS_DOEPCTRLx register is cleared to 0

Field	Name	R/W	Description
6:0	EPTRS	R/W	Endpoint Transfer Size This bit indicates the data size contained by endpoint 0 in one data transmission (in byte).
18:7	Reserved		
19	EPPCNT	R/W	Endpoint Packet Count This bit will decrease to 0 after RXFIFO is written to a data packet.
28:20	Reserved		
30:29	SPCNT	R/W	SETUP Packet Count These bits indicate the number of SETUP dat packets that can be received continuously 01: 1 10: 2 11: 3

26.10 OTG_HS1 global register functional description

26.10.1 High-speed OTG control state register (OTG_HS1_GCTRLSTS)

Offset address: 0x00

Reset value: 0x0000 0800

Field	Name	R/W	Description
0	SREQSUC	R	Session Request Success 0: Session request fails 1: Session request succeeds Note: It can be used only in device mode
1	SREQ	R/W	Session Request 0: No request session 1: Request session When HNSUCCHG bit of OTG_HS1_GINT register is set, this bit will be cleared by writing 0. This bit will be cleared to 0 when HNSUCCHG is cleared to 0. When USB 1.1 full-speed serial transceiver interface is used for session request, wait for V _{BUS} to discharge to 0.2 V after the BSVD bit of the register is cleared to 0. The discharge time may be different according to different PHY. Note: It can be used only in device mode
7:2	Reserved		
8	HNSUC	R	Host Negotiation Success This bit will be cleared to 0 when HNPREQ of this register is set to 1 0: Host negotiation fails 1: Host negotiation succeeds Note: It can be used only in device mode
9	HNPREQ	R/W	Host Negotiation Protocol Request (HNP Request) 0: Not transmit HNP request 1: Transmit HNP request When HNSUCCHG bit of OTG_HS1_GINT register is set, this bit will be cleared by writing 0. This bit will be cleared to 0 when HNSUCCHG is cleared to 0. Note: It can be used only in device mode
10	HHNPEN	R/W	Host Set HNP Enable 0: Disable 1: Enable Note: It can be used only in master mode

Field	Name	R/W	Description
11	DHNPEN	R/W	Device HNP Enable 0: Disable 1: Enable Note: It can be used only in device mode
15:12	Reserved		
16	CIDSTS	R	Connector ID Status 0: OTG_HS1 controller is in Device A mode 1: OTG_HS1 controller is in Device B mode Note: It can be used in both device and master modes
17	LSDEBT	R	Long/Short Debounce Time 0: Long debounce time 1: Short debounce time Note: It can be used only in master mode
18	ASVD	R	A-Session Valid 0: Invalid 1: Valid Note: It can be accessed only in master mode
19	BSVD	R	B-Session Valid In OTG mode, this bit is used to confirm whether the device is in connected status. 0: Invalid 1: Valid Note: It can be accessed only in device mode
31:20	Reserved		

26.10.2 High-speed OTG interrupt register (OTG_HS1_GINT)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
1:0	Reserved		
2	SEFLG	RC_W1	Session End Flag When $V_{BUS} < 0.8V$, it means that V_{BUS} is not used for B-session, and this bit will be set to 1.
7:3	Reserved		
8	SREQSUCCHG	RC_W1	Session Request Success Flag If the value of SREQSUC bit changes, this bit will be set to 1. Note: It can be accessed in both device and master mode
9	HNSUCCHG	RC_W1	Host Negotiation Success Flag If the value of HNSUC bit changes, this bit will be set to 1. Note: It can be accessed in both device and master mode
16:10	Reserved		

Field	Name	R/W	Description
17	HNFLG	RC_W1	Host Negotiation Flag When USB host negotiation request is detected, this bit will be set to 1.
18	ADTOFLG	RC_W1	A-Device Timeout Flag If this bit is set to 1, it indicates timeout when A-device is waiting for B-device to connect. Note: It can be accessed in both device and master mode
19	DEBDFLG	RC_W1	Debounce Done Flag When the equipment is connected and debounce is completed, this bit shall be set to 1; when an interrupt is generated, the USB will be reset. This bit is valid only when HNPEN and SRPEN bits of OTG_HS1_GUSBCFG register are set to 1. Note: It can be accessed only in master mode
31:20	Reserved		

26.10.3 High-speed OTG AHB configuration register (OTG_HS1_GAHBCFG)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	GINTMASK	R/W	Global Interrupt Mask 0: Mask global interrupt 1: Unmask global interrupt
4:1	BLT	R/W	Burst Length/Type 0000: Single time 0001: INCR 0011: INCR4 0101: INCR8 0111: INCR16 Others: Reserved
5	DMAEN	R/W	DMA Enable 0: Run in slave mode 1: Run in DMA mode
6	Reserved		
7	TXFEL	R/W	TXFIFO Empty Level 0: TXFE interrupt means that IN endpoint TXFIFIO is half-empty 1: TXFE interrupt means that IN endpoint TXFIFIO is all-empty Note: It can be accessed only in device mode
8	PTXFEL	R/W	Periodic TXFIFO Empty Level 0: PTXFE interrupt means that periodic TXFIFIO is half-empty 1: PTXFE interrupt means that periodic TXFIFIO is all-empty Note: It can be accessed only in master mode
31:9	Reserved		

26.10.4 High-speed OTG USB configuration register (OTG_HS1_GUSBCFG)

Offset address: 0x0C

Reset value: 0x0000 0A00

Field	Name	R/W	Description
2:0	SEFLG	R/W	FS Timeout Calibration The additional delay of PHY includes the number of PHY clocks and FS timeout interval. The status of data line may be different for different PHY.. The timeout value of OTG_FS is 16~18-bit time.
5:3	Reserved		
6	FSSTSEL	W	Full-Speed Serial Transceiver Select 0: USB2.0 high-speed ULPI PHY 1: USB1.1 full-speed serial transceiver
7	Reserved		
8	SRPEN	R/W	SRP Enable 0: Disable 1: Enable If the SRP function is disabled, connecting the device cannot be requested to activate V _{BUS} and the session cannot be started.
9	HNPEN	R/W	HNP Enable 0: Disable 1: Enable
13:10	TRTIM	R/W	USB Turnaround Time $f_{PHYCLK} = 48\text{MHz}$, in f_{PHYCLK} . The clock frequency of AHB is at least 30MHz. $TRTIM = 4 \times f_{AHBCLK} + f_{PHYCLK}$ Example: When $f_{AHBCLK} = 72\text{MHz}$, TRTIM will be set to 7.
14	Reserved		
15	PHYLPSEL	R/W	PHY Low-Power Select 0: Internal PLL clock 480MHz 1: External clock 48MHz Generally, 48MHz clock is used. In 480MHz clock mode, UTMI interface runs at 60 (8-bit data) or 30MHz (16 bit data); in 48MHz mode, run at 48MHz.
16	Reserved		
17	ULPISEL	R/W	ULPI PHY Interface Select 0: ULPI interface 1: ULPI FS/LS serial interface This bit is valid only when FS serial transceiver is selected on ULPI PHY.

Field	Name	R/W	Description
18	ULPIAR	R/W	ULPI Auto-Resume This bit indicates whether ULPI PHY supports auto-resume function. 0: Not supported 1: Supported
19	ULPICKLP	R/W	ULPI Clock Power This bit indicates whether internal clock power supply is turned off when PHY is suspended. 0: Open 1: Not off
20	ULPIEVDSEL	R/W	ULPI External V _{BUS} Drive Select Through this bit, ULPI PHY selects to drive V _{BUS} by internal or external power supply. 0: Internal charge pump 1: External power supply
21	ULPIEVC	R/W	ULPI External V _{BUS} Compare Through this bit, ULPI PHY selects internal or external V _{BUS} effective comparator. 0: Internal 1: External
22	DPSEL	R/W	DLine Pulsing Select This bit selects the drive source of the data line pulse during SRP. 0: utmi_txvalid 1: utmi_termssel
23	SINI	R/W	Signal Invert This bit indicates whether to invert ExternalVbusIndicator signal 0: Not invert 1: Invert; PHY inverts ExternalVbusIndicator input signal and generates complementary output
24	NPTHQ	R/W	No Pass Through Qualified This bit controls whether the complementary output verifies through internal V _{BUS} effective comparator 0: Pass 1: No pass
25	ULPIPCDIS	R/W	ULPI Interface Protect Circuit Disable 0: Enable 1: Disable
28:26	Reserved

30	FDMODE	R/W	Forced Device Mode 0: Normal mode 1: Device mode, which takes effect 25ms later
31	CTXP	R/W	Corrupt TX Packet Debug bit, which cannot be set to 1.

26.10.5 High-speed OTG reset control register (OTG_HS1_GRSTCTRL)

Offset address: 0x010

Reset value: 0x2000 0000

Field	Name	R/W	Description
0	CSRST	R/S	<p>Core Soft Reset</p> <p>This bit controls HCLK and PCLK reset.</p> <p>Clear each interrupt and all CSR register bits to 0 except the followings:</p> <ul style="list-style-type: none"> ● GCLK bit in OTG_HS1_PCGCTRL ● PCLKSTOP bit in OTG_HS1_PCGCTRL ● PHYCLKSEL bit in OTG_HS1_HCFG ● DSPDSEL bit in OTG_HS1_DCFG <p>Reset the AHB slave to the idle state and clear TXFIFO and RXFIFO. When the AHB transmission ends, all transactions of AHB shall be terminated as soon as possible and all transactions on USB shall be terminated immediately.</p> <p>Software reset is used generally in either of the following situations:</p> <ul style="list-style-type: none"> ● Software development period. ● After the user dynamically changes the PHY selection bit in the USB configuration register listed above. When the user changes the PHY, the corresponding clock will be selected for the PHY and used in the PHY domain. Once a new clock is selected, the PHY domain must be reset so as to ensure normal operation
1	HSRST	R/S	<p>HCLK Soft Reset</p> <p>This bit is used to refresh the control logic of AHB clock domain.</p> <p>When clearing this interrupt, the corresponding mask interrupt state control bit shall be cleared; when the interrupt state bit is not cleared to zero, the event state after this bit is set to 1 can be read.</p>
2	HFCNTRST	R/S	<p>Host Frame Counter Reset</p> <p>Reset the frame counter in the host by writing this bit, and the SOF frame number transmitted subsequently is 0.</p> <p>Note: It can be accessed only in master mode.</p>
3	Reserved		
4	RXFFLU	R/S	<p>Flush RXFIFO</p> <p>This bit is used to refresh the whole RXFIFO. Before writing to this bit, it is required to ensure that the module does not perform read and write operation to RXFIFO.</p> <p>Only after this bit is cleared to 0, can other operations be performed (usually need to wait for 8 clock cycles).</p>
5	TXFFLU	R/S	<p>Flush TXFIFO</p> <p>This bit is used to refresh one or the whole TXFIFO. Before writing to this bit, it is required to ensure that the module does not perform read and write operation to TXFIFO.</p>

Field	Name	R/W	Description
10:6	TXFNUM	R/W	<p>TXFIFO Number</p> <p>Refresh the FIFO number with TXFIFO refresh bits, and these bits can only be changed after the refresh TXFFIO is cleared to 0.</p> <p>In master mode:</p> <p>00000: Refresh non-periodic TXFIFO</p> <p>00001: Refresh periodic TXFIFO</p> <p>10000: Refresh all TXFIFO</p> <p>In device mode:</p> <p>00000: Refresh TXFIFO 0</p> <p>00001: Refresh TXFIFO 1</p> <p>.....</p> <p>00101: Refresh TXFIFO 15</p> <p>10000: Refresh all TXFIFO</p>
29:11	Reserved		
30	DMAREQ	R	<p>DMA Request</p> <p>This bit indicates that DMA request is ongoing.</p>
31	AHBMIDL	R	<p>AHB Master Idle</p> <p>This bit indicates that the AHB master device is idle.</p>

26.10.6 High-speed OTG module interrupt register (OTG_HS1_GCINT)

Offset address: 0x014

Reset value: 0x0400 0020

In order to avoid generating interrupts before initialization, the software must clear this register to zero before enabling the interrupt bit.

Field	Name	R/W	Description
0	CURMOSEL	R	<p>Current Mode of Operation Select</p> <p>0: Device mode</p> <p>1: Master mode</p>
1	MMIS	RC_W1	<p>Mode Mismatch Interrupt</p> <p>This bit will be set to 1 when accessing the following registers:</p> <ul style="list-style-type: none"> ● Access the master mode register in device mode ● Access the device mode register in master mode
2	OTG	R	<p>OTG Interrupt</p> <p>When this bit is set to 1, it indicates that an OTG protocol event has occurred.</p>
3	SOF	RC_W1	<p>Frame Start Interrupt</p> <p>When this bit is set:</p> <ul style="list-style-type: none"> ● In master mode, it indicates that USB has transmitted one SOF (FS) or Keep-Alive (LS); ● In device mode, it indicates that USB has received one SOF, and the current frame number can be obtained by reading the device state register. An interrupt will be generated only when running in FS mode.
4	RXFNONE	R	<p>RXFIFO Non-empty Interrupt</p> <p>This bit indicates that there is at least one data packet in RXFIFO</p>

Field	Name	R/W	Description
5	NPTXFEM	R	<p>Non-periodic TXFIFO Empty Interrupt</p> <p>This interrupt will be triggered when the non-periodic TXFIFO is not empty and there is space for writable entries in the request queue.</p> <p>Note: It can be accessed only in master mode</p>
6	GINNPNAKE	R	<p>Global IN Non-periodic NAK Effective Interrupt</p> <p>This bit indicates that SGINAK bit of OTG_HS_DCTL register is valid; this bit can be cleared by clearing CGINAK bit of OTG_HS_DCTL register.</p> <p>The priority of STALL is higher than that of NAK bit.</p> <p>Note: It can be accessed only in device mode</p>
7	GONAKE	R	<p>Global OUT NAK Effective Interrupt</p> <p>This bit indicates that GONAKSET bit of OTG_HS1_DCTRL register is valid; this bit can be cleared by clearing GONALCLR bit of OTG_HS1_DCTRL.</p> <p>Note: It can be accessed only in device mode</p>
9:8	Reserved		
10	ESUS	RC_W1	<p>Early Suspend Interrupt</p> <p>When USB has been idle for 3ms, this bit will be set to 1.</p> <p>Note: It can be accessed only in device mode</p>
11	USBSUS	RC_W1	<p>USB Suspend Interrupt</p> <p>When USB suspending is detected, this bit will be set to 1; when USB has been idle for 3ms, it will enter pending state.</p> <p>Note: It can be accessed only in device mode</p>
12	USBRST	RC_W1	<p>USB Reset Interrupt</p> <p>This bit will be set to 1 when reset is detected on USB.</p> <p>Note: It can be accessed only in device mode</p>
13	ENUMD	RC_W1	<p>Enumeration Done Interrupt</p> <p>This bit will be set to 1 when speed enumeration is completed.</p> <p>Note: It can be accessed only in device mode</p>
14	ISOPD	RC_W1	<p>Isochronous OUT Packet Dropped Interrupt</p> <p>When the RXFIFO space is insufficient and synchronous OUT data packet cannot be written to RXFIFO, this bit will be set to 1</p> <p>Note: It can be accessed only in device mode</p>
15	EOPF	RC_W1	<p>End of Periodic Frame Interrupt</p> <p>This bit indicates that the current frame has reached the period specified by PFITV bit of OTG_HS1_DCFG register.</p> <p>Note: It can be accessed only in device mode</p>
17:16	Reserved		

Field	Name	R/W	Description
18	INEP	R	<p>IN Endpoint Interrupt</p> <p>This bit will be set to 1 when a suspended interrupt occurs to one IN endpoint.</p> <p>Determine the OUT endpoint to which an interrupt occurs by reading OTG_HS1_DAEPINT register, and determine the causes of the interrupt by reading OTG_HS1_DIEPINTx register; clear this bit by clearing the corresponding state bit of OTG_HS1_D1EPINTx register.</p> <p>Note: It can be accessed only in device mode</p>
19	ONEP	R	<p>OUT Endpoint Interrupt</p> <p>Determine the number of OUT endpoint to which an interrupt occurs by reading OTG_HS1_DAEPINT register, and determine the causes of the interrupt by reading OTG_HS1_DOEPINTx register.</p> <p>To clear this bit, first clear the corresponding state bit of OTG_HS1_DOEPINTx register.</p> <p>Note: It can be accessed only in device mode</p>
20	IIINTX	RC_W1	<p>Incomplete Isochronous IN Transfer Interrupt</p> <p>This bit will be set to 1 when the transmission on at least one synchronous IN endpoint in the current frame is not completed</p> <p>This interrupt is triggered at the same time with EOPF.</p> <p>Note: It can be accessed only in device mode</p>
21	IP_OUTTX	RC_W1	<p>Incomplete Periodic Transfer Interrupt</p> <p>When this bit is set to 1, the interrupts indicated by it are different in different modes.</p> <p>In the master mode, if the periodic transaction scheduled to be completed in the current frame is still pending (i.e. incomplete), the incomplete periodic transmission interrupt will be triggered.</p> <p>In device mode, when the transmission on at least one synchronous OUT endpoint in the current frame is not completed, interrupt of incomplete OUT synchronous transmission will be triggered, and this interrupt will be triggered at the same time with EOPF.</p>
22	DFSUS	R	<p>Data Fetch Suspended Interrupt</p> <p>In DMA mode, when stopping fetching data due to insufficient space of TXFIFO or request queue, a data fetch suspended interrupt will be generated.</p>
23	Reserved		
24	HPORT	R	<p>Host Port Interrupt</p> <p>This bit will be set to 1 when the state of full-speed OTG controller port changes in master mode.</p> <p>Note: It can be accessed only in master mode.</p>
25	HCHAN	R	<p>Host Channels Interrupt</p> <p>This bit will be set to 1 when a suspended interrupt is generated on host channel.</p> <p>Note: It can be accessed only in master mode.</p>

Field	Name	R/W	Description
26	PTXFE	R	Periodic TXFIFO Empty Interrupt This interrupt will be triggered when the periodic TXFIFO is empty and there is space for writable entries in the request queue. Note: It can be accessed only in master mode.
27	Reserved		
28	CINSTSC	RC_W1	Connector ID Status Change Interrupt This bit will be set to 1 when the state of connector ID line changes.
29	DEDIS	RC_W1	Device Disconnect Interrupt This bit will be set to 1 when device disconnection is detected. Note: It can be accessed only in master mode
30	SREQ	RC_W1	Session Request/New Session Interrupt In different modes, the conditions for triggering this interrupt are: <ul style="list-style-type: none"> ● Session request is detected in master mode ● In device mode, V_{BUS} is within the range of B-device
31	RWAKE	RC_W1	Resume/Remote Wakeup Interrupt In different modes, the conditions for triggering this interrupt are: <ul style="list-style-type: none"> ● Remote wakeup signal is detected on USB in master mode ● Resume signal is detected on USB bus in device mode

26.10.7 High-speed OTG module interrupt mask register (OTG_HS1_GINTMAS)

Offset address: 0x018

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	Reserved		
1	MMISM	R/W	Mode Mismatch Interrupt Mask 0: Mask the interrupt 1: Interrupt

26.10.8 High-speed OTG read debug receive state register/high-speed OTG state read and pop register (OTG_HS1_GRXSTS/OTG_HS1_GRXSTSP)

Read offset address: 0x01C

Pop offset address: 0x020

Reset value: 0x0000 0000

Master mode

Field	Name	R/W	Description
3:0	CHNUM	R	Channel Number This bit indicates the received data is transmitted by which channel.
14:4	BCNT	R	Byte Count This bit indicates the byte count of received IN data packet.
16:15	DPID	R	Data PID This bit indicates the PID of received data packet 00: DATA0 10: DATA1 01: DATA2 11: MDATA
20:17	PSTS	R	Packet Status This bit indicates the status of the received data packet. 0010: Received IN data packet 0011: IN transmission completed 0101: Data synchronization error 0111: Channel stop Others: Reserved
31:21	Reserved		

Device mode

Field	Name	R/W	Description
3:0	EPNUM	R	Endpoint Number This bit indicates the received data is transmitted by which endpoint.
14:4	BCNT	R	Byte Count This bit indicates the byte count of received data packet.
16:15	DPID	R	Data PID This bit indicates the received data packet ID (PID). 00: DATA0 01: DATA2 10: DATA1 11: MDATA
20:17	PSTS	R	Packet Status This bit indicates the status of received data packet 0001: Global OUT NAK 0010: Received OUT data packet 0011: OUT transmission completed

Field	Name	R/W	Description
			0100: SETUP event completed 0110: Received SETUP data packet Others: Reserved
24:21	FNUM	R	Frame Number These bits are valid when synchronous OUT endpoint is supported. These bits are the 4 least significant bits of the packet frame number received on the USB.
31:25	Reserved		

26.10.9 High-speed OTG receive FIFO size register (OTG_HS1_GRXFIFO)

Offset address: 0x024

Reset value: 0x0000 0200

Field	Name	R/W	Description
15:0	RXFDEP	R/W	RXFIFO Depth RXFIFO is in word, and the depth range is: 16~1024.
31:16	Reserved		

26.10.10 High-speed OTG TXFIFO configuration register (OTG_HS1_GTXFCFG)

Offset address: 0x028

Reset value: 0x0000 0200

Master mode

Field	Name	R/W	Description
15:0	NPTXSA	R/W	Nonperiodic TXFIFO RAM Start Address This bit indicates the start address of non-periodic TXFIFO RAM.
31:16	NPTXFDEP	R/W	Nonperiodic TXFIFO Depth TXFIFO is in word, and the depth range is: 16~1024.

Device mode

Field	Name	R/W	Description
15:0	EPTXSA	R/W	Endpoint0 TXFIFO RAM Start Address This bit indicates the start address of TXFIFO RAM of endpoint 0.
31:16	EPTXFDEP	R/W	Endpoint0 TXFIFO Depth TXFIFO is in word, and the depth range is: 16~256.

26.10.11 High-speed OTG non-periodic TXFIFO queue state register (OTG_HS1_GNPTXFQSTS)

Offset address: 0x02C

Reset value: 0x0008 0200

Field	Name	R/W	Description
15:0	NPTXFSA	R	<p>Nonperiodic TXFFIO Space Available</p> <p>These bits indicate the size of available space of non-periodic TXFIFO. (In 32-bit words)</p> <p>hx0: Non-periodic TXFIFO is full</p> <p>hx1: 1 word</p> <p>hx2: 2 words</p> <p>.....</p> <p>hxn: n words are available ($0 \leq n \leq 16$)</p> <p>Others: Reserved</p>
23:16	NPTXRSA	R	<p>Non-periodic Transmit Request Space Available</p> <p>This bit indicates the available space size of non-periodic transmit request queue.</p> <p>In master mode: Save IN and OUT requests</p> <p>In device mode: There is only IN request</p> <p>hx0: The queue is full</p> <p>hx1: 1 position</p> <p>hx2: 2 positions</p> <p>.....</p> <p>hxn: n positions are available ($0 \leq n \leq 8$)</p> <p>Others: Reserved</p>

31	Reserved		

26.10.12 High-speed OTG I2C access register (OTG_HS1_GI2CAC)

Offset address: 0x030

Reset value: 0x0000 0000

Field	Name	R/W	Description
7:0	SRWD	R/W	<p>Storage I2C Read/Write Data</p> <p>After read operation, these bits store the data read by the program.</p> <p>During write operation, these bits store the data to be written by the program.</p>
15:8	RADDR	R/W	<p>I2C Register Address</p> <p>These bits are used to store the register address to be read/written.</p>
22:16	DADDR	R/W	<p>I2C Device Address</p> <p>These bits indicate 7-bit I2C device addresses, and can be used to access external I2C slave devices, including I2C slave devices of full-speed serial transceiver.</p>

Field	Name	R/W	Description
23	I2CEN	R/W	I2C Enable 0: Disable 1: Enable
24	ACK	R/W	I2C ACK This bit indicates whether to receive ACK from I2C. 0: NAK 1: ACK This bit is valid when I2C is enabled and I2CSTSFLG bit is cleared to 0.
25	Reserved		
27:26	DADDRSEL	R/W	I2C Device Address Select These bits are selected for I2C slave device address of the full-speed serial transceiver used for OTG signals.
28	USBMSEL	R/W	I2C USB Mode Select 0: VP_VM USB mode 1: DAT_SE0 USB mode
29	Reserved		
30	RTRCFG	R/W	Register Transfer Configure This bit indicates it is transmission of read register or write register. 0: Write 1: Read
31	I2CSTSFLG	R/W	I2C Status Flag 0: Idle 1: Busy, used to enable one request of I2C

26.10.13 High-speed OTG general module configuration register (OTG_HS1_GGCCFG)

Offset address: 0x038

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	Reserved		
16	PWEN	R/W	Power Down Enable This bit is used to activate the transceiver when transmitting /receiving. 0: Activate 1: Disable (activate the transceiver)
17	I2CBEN	R/W	I2C Bus Enable This bit is used to connect external PHY of I2C interface. 0: Disable 1: Enable
18	ADVBSSEN	R/W	A Device V _{BUS} Sensing Enable 0: Disable 1: Enable

Field	Name	R/W	Description
19	BDVBSSEN	R/W	B Device V _{BUS} Sensing Enable 0: Disable 1: Enable
20	SOFPOUT	R/W	SOF Pulse Available on PAD Output Enable This bit selects whether SOF pulse can be output from PAD. 0: No 1: Yes
21	VBSDIS	R/W	V _{BUS} Sensing Disable 0: Enable V _{BUS} sensing 1: Disable V _{BUS} sensing
31:22	Reserved		

26.10.14 High-speed OTG module ID register (OTG_HS1_GCID)

Offset address: 0x03C

Reset value: 0x0000 1100

Field	Name	R/W	Description
31:0	PID	R/W	Product ID ID can be programmed by this bit.

26.10.15 High-speed OTG host periodic TXFIFO size register (OTG_HS1_GHPTXFSIZE)

Offset address: 0x100

Reset value: 0x0200 0600

Field	Name	R/W	Description
15:0	HPDXTXFSA	R/W	Host Periodic TXFIFO Start Address
31:16	HPDXTXFDEP	R/W	Host Periodic TXFIFO Depth TXFIFO is in word. The minimum value is 16, and the maximum value is 512.

26.10.16 High-speed OTG device IN endpoint TXFIFO size register x (OTG_HS1_GHPTXFIFOx) (x=1~7)

Offset address: 0x104+4(x-1)

Reset value: 0x0200 0400

x is FIFO number.

Field	Name	R/W	Description
15:0	INEPTXFRSA	R/W	IN Endpoint TXFIFOx Transmit RAM Start Address These bits indicate the start address of the IN endpoint TXFIFOx RAM and need to be aligned with the 32-bit memory.
31:16	INEPTXFDEP	R/W	IN Endpoint TXFIFO Depth Depth range is: 16~512 The power-on reset value is the maximum IN endpoint depth.

26.11 OTG_HS1 host mode register address mapping

Table 134 OTG_HS1 Host Mode Register Address Mapping

Register name	Description	Offset address
OTG_HS1_HCFG	High-speed OTG host configuration register	0x400
OTG_HS1_HFIVL	High-speed OTG host frame interval register	0x404
OTG_HS1_HFIFM	High-speed OTG host frame information register	0x408
OTG_HS1_HPTXSTS	High-speed OTG host periodic transmission state register	0x410
OTG_HS1_HACHINT	High-speed OTG host all-channel interrupt register	0x414
OTG_HS1_HACHIMASK	High-speed OTG host all-channel interrupt mask register	0x418
OTG_HS1_HPORTCSTS	High-speed OTG host port control state register	0x440
OTG_HS1_HCHX	High-speed OTG host channel-X characteristics register (X=0...11)	0x500+20*X
OTG_HS1_HCHSCTRLX	High-speed OTG host channel-X split-ranging control register (X=0...11)	0x504+20*X
OTG_HS1_HCHINTX	High-speed OTG host channel-X interrupt register (X=0...11)	0x508+20*X
OTG_HS1_HCHIMASKX	High-speed OTG host channel-X interrupt mask register (X=0...11)	0x50C+20*X
OTG_HS1_HCHTSIZEX	High-speed OTG host channel-X transmission size register (X=0...11)	0x510+20*X
OTG_HS1_HCHDMA	High-speed OTG host channel-X DMA address register (X=0...11)	0x514+20*X

26.12 OTG_HS1 host mode register functional description

26.12.1 High-speed OTG host configuration register (OTG_HS1_HCFG)

Offset address: 0x400

Reset value: 0x0000 0000

Field	Name	R/W	Description
1:0	PHYCLKSEL	R/W	<p>FS/LS PHY Clock Select</p> <p>This bit is used to select the PHY clock frequency when the USB is in FS and LS host mode respectively.</p> <ul style="list-style-type: none"> ● When the USB is in FS host mode: <ul style="list-style-type: none"> 10: 48MHz Others: Reserved ● When the USB is in LS host mode: <ul style="list-style-type: none"> 00: Reserved 01: 48MHz 10: 6MHz

Field	Name	R/W	Description
			11: Reserved Note: Software reset is required before change.
2	HSSPT	R	HS Support This bit is used to control whether the connected device supports HS communication. 0: Support HS/FS/LS 1: Only support FS/LS, and do not support HS
31:3	Reserved		

26.12.2 High-speed OTG host frame interval register (OTG_HS1_HFIVL)

Offset address: 0x404

Reset value: 0x0000 EA60

Field	Name	R/W	Description
15:0	FIVL	R/W	Frame Interval This bit is used to indicate the time interval between two continuous SOF, micro-SOF or Keep-Alive tokens. If the application does not specify, the value of the interval is calculated by the following formula: Frame interval=frame duration×PHY clock frequency
31:16	Reserved		

26.12.3 High-speed OTG host frame information register (OTG_HS1_HFIFM)

Offset address: 0x408

Reset value: 0x0000 3FFF

Field	Name	R/W	Description
15:0	FNUM	R	Frame Number This bit is equivalent to a counter. Every time a new SOF is transmitted on USB, the value of this bit will increase by 1, and when it reaches 0x3FFF, it will be cleared to 0.
31:16	FRTIME	R	Frame Remaining Time This bit indicates the remaining time of current frame. Every time 1 PHY clock passes by, this bit will decrease by 1 and when it becomes 0, the value will be reloaded, and a new SOF will be transmitted on USB.

26.12.4 High-speed OTG host periodic transmission state register (OTG_HS1_HPTXSTS)

Offset address: 0x410

Reset value: 0x0008 0100

Field	Name	R/W	Description
15:0	FSPACE	R/W	Periodic Transmit Data FIFO Available Space This bit indicates the idle space of periodic TXFIFO (in 32-bit word). hx0000: TXFIFO is full hx0001: 1 word hx0010: 2 words

Field	Name	R/W	Description
			hxn: dxn words (0≤dxn≤dx512) Others: Reserved
23:16	QSPACE	R	Periodic Transmit Request Queue Available Space This bit indicates the available space of transmit request queue (in 32-bit word), hx00: TXFIFO is full hx01: 1 word hx10: 2 words hxn: dxn words (0≤dxn≤dxHPDPTXFDEP) Others: Reserved Note: HPDPTXFDEP bit is in OTG_HS1_GHPTXFIFO register.
31:24	QTOP	R	Top of the Periodic Transmit Request Queue This bit is used to indicate the item currently being processed by the MAC in the periodic Tx request queue. Bit 31: Odd/even frame 0: Even frame 1: Odd frame Bit 30:27: Channel/endpoint number Bit 26:25: Type 00: Input/output 01: Zero-length data packet 11: Disable channel command Bit 24: End

26.12.5 High-speed OTG host all-channel interrupt register (OTG_HS1_HACHINT)

Offset address: 0x414

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	ACHINT	R	All Channels Interrupts No. X bit represents interrupt of Channel X. Up 16 channels.
31:16	Reserved		

26.12.6 High-speed OTG host all-channel interrupt mask register (OTG_HS1_HACHIMASK)

Offset address: 0x418

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	ACHIMASK	R/W	All Channels Interrupts Mask No. X bit represents interrupt mask of Channel X. Up 16 channels. 0: Mask 1: Not mask
31:16	Reserved		

26.12.7 High-speed OTG host port control state register (OTG_HS1_HPORTCSTS)

Offset address: 0x440

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	PCNNTFLG	R/W	Port Connect Flag This bit indicates whether this port is connected to the device. 0: Not connected 1: Connected
1	PCINTFLG	RC_W1	Port Connect Interrupt for Flag Triggering An interrupt will be triggered when the port connection is detected by this bit.
2	PEN	RC_W0	Port Enable 0: Disable 1: Enable
3	PENCHG	RC_W1	PEN Bit Change This bit will be set to 1 when PEN bit of this register changes.
4	POVC	R	Port Overcurrent This bit indicates whether this port is overloaded. 0: No overload 1: Overload
5	POVCCHG	RC_W1	POVC Bit Change This bit will be set to 1 when POVC bit changes.
6	PRS	R/W	Port Resume When the USB remote wake-up signal is received, the resume signal will be driven on this port. 0: Not drive 1: Drive
7	PSUS	R/S	Port Suspend It is used to indicate whether the port is in suspended mode. When the port is suspended, USB will stop transmitting SOF. 0: Not suspended 1: Suspended
8	PRST	R/W	Port Reset It is used to control the port to initiate resume signal. 0: Not reset 1: Reset
9	Reserved		
11:10	PDLSTS	R	Port Data Line Status This bit is used to indicate the logic level of the data queue of USB port. [10] indicates logic level of OTG_HS_FS_DP [11] indicates logic level of OTG_HS_FS_DM Others: Reserved

Field	Name	R/W	Description
12	PP	R/W	Port Power This bit is used to control power-on of the port. 0: Power down 1: Power on
16:13	PTSEL	R/W	Port Test Mode Select This bit is used to select the mode signal generated by the port. 0000: Test is disabled 0001: Test_J 0010: Test_K 0011: Test_SE0_NAK 0100: Test_Packet 0101: Test_Force_Enable Others: Reserved
18:17	PSPDSEL	R	Port Speed Select 00: High speed 01: Full speed 10: Low speed 11: Reserved
31:19	Reserved		

26.12.8 High-speed OTG host channel-X characteristics register (OTG_HS1_HCHX) (X=0...11)

Offset address: 0x500+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
10:0	MAXPSIZE	R/W	Maximum Data Packet Size This bit indicates the maximum data packet size of the device endpoint communicating with the host.
14:11	EDPNUM	R/W	Endpoint Number This bit indicates the number of the device endpoint communicating with the host.
15	EDPDRT	R/W	Endpoint Direction 0: OUT 1: IN
16	Reserved		
17	LSDV	R/W	Low-speed Device 0: Communicate with non-LS device 1: Communicate with LS device
19:18	EDPTYP	R/W	Endpoint Type This bit indicates the transmission type selected for the endpoint. 00: Control 01: Synchronous 10: Batch 11: Interrupt

Field	Name	R/W	Description
21:20	CNTSEL	R/W	<p>Count Function Select</p> <p>Through SPLEN bit of HCHSCTRLX register, this bit can be selected for the counter used for indication.</p> <p>When SPLEN=0:</p> <p>This bit specifies the number of transactions to be executed by the periodic endpoint per micro-frame, or the number of data packets to be obtained by the channel during non-periodic transmission.</p> <p>00: Reserved 01: 1 transaction 10: 2 transactions 11: 3 transactions</p> <p>When SPLEN=1:</p> <p>This bit is used to set the number of times of retrying the transaction immediately when an error occurs in the periodic separation transaction. At this time, this bit shall be set to at least 01.</p>
28:22	DVADDR	R/W	<p>Device Address</p> <p>This bit indicates the device communicating with the host.</p>
29	ODDF	R/W	<p>Odd Frame</p> <p>For periodic transactions, this bit controls whether the host transmits odd or even frames.</p> <p>0: Even frame 1: Odd frame</p>
30	CHINT	R/S	<p>Channel Interrupt</p> <p>0: No operation 1: Stop transmitting data through the channel</p>
31	CHEN	R/S	<p>Channel Enable</p> <p>0: Disable 1: Enable</p>

26.12.9 High-speed OTG host channel-X split-ranging control register (OTG_HS1_HCHSCTRLX) (X=0...11)

Offset address: 0x504+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
6:0	PADDR	R/W	<p>Port Address</p> <p>This bit is used to store the port number of the receiving-end transaction forwarder.</p>
13:7	HADDR	R/W	<p>Hub Address</p> <p>This bit is used to store the hub device address of the transaction forwarder.</p>
15:14	TPOST	R/W	<p>Transaction Position</p> <p>This bit is used to determine to transmit the load in which position of the OUT transaction.</p> <p>00: Middle 01: End 10: Start</p>

Field	Name	R/W	Description
			11: All
16	DO_CMP_SPL	R/W	Do Complete Split 0: Reserved 1: Transmit the request to the host to perform complete split transaction
30:17	Reserved		
31	SPLEN	R/W	Split Enable 0: Disable 1: Enable; the channel is enabled to execute split transaction

26.12.10 High-speed OTG host channel-X interrupt register (OTG_HS1_HCHINTX) (X=0...11)

Offset address: 0x508+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPN	RC_W1	Transfer Complete Normally The transmission is completed normally without error.
1	TSFCMPAN	RC_W1	Transfer Complete Abnormally The transmission is abnormal, causing abnormal end.
2	AHBERR	RC_W1	AHB Error Error that occurs only in DMA mode and during AHB read/write operation.
3	RXSTALL	RC_W1	STALL Response Received Interrupt
4	RXNAK	RC_W1	NAK Response Received Interrupt
5	RXTXACK	RC_W1	ACK Response Received/Transmitted Interrupt
6	RXNYET	RC_W1	NYET Response Received Interrupt
7	TERR	RC_W1	Transaction Error Indicate that one of the following errors occurs: CRC failure Timeout Bit stuffing error EOP error
8	BABBLE	RC_W1	Babble Error
9	FOVR	RC_W1	Frame Overrun Error
10	DTOG	RC_W1	Data Toggle Error
31:11	Reserved		

26.12.11 High-speed OTG host channel-X interrupt mask register (OTG_HS1_HCHIMASKX) (X=0...11)

Offset address: 0x50C+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPNM	R/W	Transfer Complete Normally Mask 0: Mask 1: Interrupt
1	TSFCMPANM	R/W	Transfer Complete Abnormally Mask 0: Mask 1: Interrupt
2	AHBERRM	R/W	AHB Error Mask 0: Mask 1: Interrupt
3	RXSTALLM	R/W	STALL Response Received Interrupt Mask 0: Mask 1: Interrupt
4	RXNAKM	R/W	NAK Response Received Interrupt Mask 0: Mask 1: Interrupt
5	RXTXACKM	R/W	ACK Response Received/Transmitted Interrupt 0: Mask 1: Interrupt
6	RXNYETM	R/W	NYET Response Received Interrupt Mask 0: Mask 1: Interrupt
7	TERRM	R/W	Transaction Error Mask 0: Mask 1: Interrupt
8	BABBLEM	R/W	Babble Error Mask 0: Mask 1: Interrupt
9	FOVRM	R/W	Frame Overrun Error Mask 0: Mask 1: Interrupt
10	DTOGM	R/W	Data Toggle Error Mask 0: Mask 1: Interrupt
31:11	Reserved		

26.12.12 High-speed OTG host channel-X transmission size register (OTG_HS1_HCHTSIZE_X) (X=0...11)

Offset address: 0x510+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
18:0	TSFSIZE	R/W	Transfer Size For OUT: The value of this bit indicates the number of data bytes to be transmitted by the host. For IN: This bit indicates the buffer size.

Field	Name	R/W	Description
28:19	PCKTCNT	R/W	Packet Count This bit is used to record the number of transmitted or received data packets.
30:29	DATAPID	R/W	Data PID This bit is used to set the initial PID when the host transmits data communication and is maintained during transmission. 00: DATA0 01: DATA2 10: DATA1 11: MDATA (controlled transmission)/SETUP (uncontrolled transmission)
31	DO_PING	R/W	Do PING Protocol 0: No operation 1: Execute PIN protocol Note: This bit can be set to 1 only during OUT transmission.

26.12.13 High-speed OTG host channel-X DMA address register (OTG_HS1_HCHDMAX) (X=0...11)

Offset address: 0x514+20*X

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	ADDR	R/W	DMA Address This bit is used to store the memory address of DMA transmission used by host and device to transmit data.

26.13 OTG_HS1 device mode register address mapping

Table 135 OTG_HS1 Device Mode Register Address Mapping

Register name	Description	Offset address
OTG_HS1_DCFG	High-speed OTG device configuration register	0x800
OTG_HS1_DCTRL	High-speed OTG device control register	0x804
OTG_HS1_DSTS	High-speed OTG device state register	0x808
OTG_HS1_DINIMASK	High-speed OTG device IN endpoint interrupt mask register	0x810
OTG_HS1_DOUTIMASK	High-speed OTG device OUT endpoint interrupt mask register	0x814
OTG_HS1_DAEPINT	High-speed OTG device all-endpoint interrupt register	0x818
OTG_HS1_DAEPIMASK	High-speed OTG device all-endpoint interrupt mask register	0x81C
OTG_HS1_DVBUSDTIM	High-speed OTG device VBUS release time register	0x828
OTG_HS1_DVBUSPTIM	High-speed OTG device VBUS pulse time register	0x82C

Register name	Description	Offset address
OTG_HS1_DTHCTRL	High-speed OTG device threshold control register	0x830
OTG_HS1_DIEIMASK	High-speed OTG device IN endpoint FIFO empty interrupt mask register	0x834
OTG_HS1_DEPINT	High-speed OTG device single-endpoint interrupt register	0x838
OTG_HS1_DEPIMASK	High-speed OTG device single-endpoint interrupt mask register	0x83C
OTG_HS1_DIN1IMASK	High-speed OTG device IN endpoint 1 interrupt mask register	0x844
OTG_HS1_DOUT1MASK	High-speed OTG device OUT endpoint 1 interrupt mask register	0x884
OTG_HS1_DIEPCTRLx	High-speed OTG device IN endpoint x control register (x=0...7)	0x900+20x
OTG_HS1_DIEPINTx	High-speed OTG device IN endpoint x interrupt register (x=0...7)	0x908+20x
OTG_HS1_DIEPTRS0	High-speed OTG device IN endpoint 0 transmission size register	0x910
OTG_HS1_DIEPTRSx	High-speed OTG device IN endpoint x transmission size register (x=1...3)	0x910+20x
OTG_HS1_DIEPDMAx	High-speed OTG device IN endpoint x DMA address register (x=1...5)	0x914+20x
OTG_HS1_DITXFSTx	High-speed OTG device IN endpoint x TXFIFO state register (x=0...5)	0x918+20x
OTG_HS1_DOEPCTRL0	High-speed OTG device OUT endpoint 0 control register	0xB00
OTG_HS1_DOEPCTRLx	High-speed OTG device OUT endpoint x control register (x=1...3)	0xB00+20x
OTG_HS1_DOEPINTx	High-speed OTG device OUT endpoint x interrupt register (x=0...7)	0xB08+20x
OTG_HS1_DOEPTRS0	High-speed OTG device OUT endpoint 0 transmission size register	0xB10
OTG_HS1_DOEPTRSx	High-speed OTG device OUT endpoint x transmission size register (x=1...5)	0xB10+20x
OTG_HS1_DOEPDMAx	High-speed OTG device OUT endpoint x DMA address register (x=1...5)	0xB14+20x

26.14 OTG_HS1 device mode register functional description

26.14.1 High-speed OTG device configuration register (OTG_HS1_DCFG)

Offset address: 0x800

Reset value: 0x0220 0000

Field	Name	R/W	Description
1:0	DSPDSEL	R/W	Device Speed Select This bit is used to select the speed of this module. 00: High speed 01: Reserved 10: Reserved 11: Full speed
2	SENDOUT	R/W	Transmit the Received OUT Packet on Nonzero-length Status At the transmission OUT transaction stage, when the module receives a data packet with non-zero length, select the handshake signal to be transmitted by the program. 0: Transmit the received OUT data packet with zero or non-zero length to the application program and reply the NAK or STALL handshake signal 1: OUT data packets with non-zero length is not transmitted, and the STALL handshake signal is replied
3	Reserved		
10:4	DADDR	R/W	Device Address The application program writes the device address to this bit after the SetAddress command is executed.
12:11	PFITV	R/W	Periodic (Micro) Frame Interval This bit is used to select the time point (within one (micro) frame), and the time point is used to indicate when the periodic (micro) frame end interrupt must be used to notify the application program. 00: 80% of frame interval 01: 85% of frame interval 10: 90% of frame interval 11: 95% of frame interval
23:13	Reserved		
25:24	PSITV	R/W	Periodic Scheduling Interval It indicates the time allocated by DMA to obtain the periodic IN endpoint data. 00: 25% (micro) frame 01: 50% (micro) frame 10: 75% (micro) frame 11: Reserved
31:26	Reserved		

26.14.2 High-speed OTG device control register (OTG_HS1_DCTRL)

Offset address: 0x804

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	RWKUPS	R/W	Remote Wakeup Signaling Transmit the remote wake-up signal, which can make the USB exit the suspended state, so as to wake up the USB host. 0: No operation 1: Transmit

Field	Name	R/W	Description
1	SDCNNT	R/W	Soft Disconnect Soft disconnect means that the host cannot learn that the device is connected, and the device cannot receive the signal on USB. 0: Work normally 1: The application program transmits soft disconnection signal Note: The USB will be always disconnected until this bit is cleared to 0.
2	GINAKSTS	R	Global IN NAK Status This bit controls whether the reply handshake signal is related to the data availability in the transmit FIFO. 0: Related 1: Unrelated; all non-periodic IN endpoints reply NAK handshake signal
3	GONAKSTS	R	Global OUT NAK Status 0: Reply handshake signal according to the FIFO state and related configuration bit 1: No data is received, discard all OUT data packets and all data packets reply the NAK handshake signal
6:4	TESTSEL	R/W	Test Mode Select 000: Disable the test 001: Test_J 010: Test_K 011: Test_SE0_NAK 100: Test_Packet 101: Test_Force_Enable Others: Reserved
7	GINAKSET	W	Global IN NAK Setup This bit can be set to 1 only when GINNPNAKEI bit of OTG_HS1_GCINT register is 0, so as to make all non-periodic IN ports transmit the NAK handshake signal.
8	GINAKCLR	W	Global IN NAK Clear When this bit is set to 1, GINAKSET bit will be cleared.
9	GONAKSET	W	Global OUT NAK Setup This bit can be set to 1 only when GONAKEI bit of OTG_HS1_GCINT register is 0, so as to make all OUT ports transmit the NAK handshake signal.
10	GONAKCLR	W	Global OUT NAK Clear When this bit is set to 1, GONAKSET bit will be cleared.
11	POPROGCMP	R/W	Power-on Programming Complete This bit indicates that the register has completed the programming operation after wake-up from power-down mode.
31:12	Reserved		

26.14.3 High-speed OTG device state register (OTG_HS1_DSTS)

Offset address: 0x808

Reset value: 0x0000 0010

Field	Name	R/W	Description
0	SUSSTS	R	Suspend Status 0: Non-suspended state 1: Suspended state
2:1	ENUMSPD	R	Enumerated Speed Enumeration speed after controlling OTG_HS1 to detect the speed through chirp sequence. 00: High speed 01: Reserved 10: Reserved 11: Full speed
3	ERTERR	R	Erratic Error 0: No irregular error 1: Irregular error is detected
7:4	Reserved		
21:8	SOFNUM	R	Frame Number of the Received SOF This bit stores the frame number of receiving SOF.
31:22	Reserved		

26.14.4 High-speed OTG device IN endpoint interrupt mask register (OTG_HS1_DINIMASK)

Offset address: 0x810

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPM	R/W	Transfer Completed Interrupt Mask 0: Mask 1: Interrupt
1	EPDISM	R/W	Endpoint Disable Interrupt Mask 0: Mask 1: Interrupt
2	Reserved		
3	TOM	R/W	Timeout Interrupt Mask 0: Mask 1: Interrupt
4	ITXEMPM	R/W	IN Token Received when TxFIFO Empty Mask 0: Mask 1: Interrupt
5	IEPMMM	R/W	IN Token Received with Endpoint Mismatch Mask 0: Mask 1: Interrupt
6	IEPNAKEM	R/W	IN Endpoint NAK Effective Mask 0: Mask 1: Interrupt
7	Reserved		

Field	Name	R/W	Description
8	FUDRM	R/W	FIFO Underrun Mask 0: Mask 1: Interrupt
9	BNAM	R/W	BNA Interrupt Mask 0: Mask 1: Interrupt
31:10	Reserved		

26.14.5 High-speed OTG device OUT endpoint interrupt mask register (OTG_HS1_DOUTIMASK)

Offset address: 0x814

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPM	R/W	Transfer Completed Interrupt Mask 0: Mask 1: Interrupt
1	EPDISM	R/W	Endpoint Disable Interrupt Mask 0: Mask 1: Interrupt
2	Reserved		
3	SETPCMPM	R/W	SETUP Phase Complete Mask 0: Mask 1: Interrupt
4	OTXEMPM	R/W	OUT Token Received when Endpoint Disabled Mask 0: Mask 1: Interrupt
5	Reserved		
6	BTBSETM	R/W	Back-to-back SETUP Packets Received Mask 0: Mask 1: Interrupt
7	Reserved		
8	OPCKTERRM	R/W	OUT Packet Error Mask 0: Mask 1: Interrupt
9	BNAM	R/W	BNA Interrupt Mask 0: Mask 1: Interrupt
31:10	Reserved		

26.14.6 High-speed OTG device all-endpoint interrupt register (OTG_HS1_DAEPINT)

Offset address: 0x818

Reset value: 0x0000 0000

The corresponding bits of the register correspond to the bits of OTG_HS1_DIEPINTx/OTG_HS1_DOEPINTx, and the corresponding endpoint interrupt bits need to be consistent.

Field	Name	R/W	Description
15:0	INEPINT	R	All IN Endpoint Interrupts No. X bit indicates interrupt of IN endpoint X. Up to 16 IN endpoints.
31:16	OUTEPINT	R	All OUT Endpoint Interrupts No. X bit indicates interrupt of OUT endpoint (X-16). Up to 16 OUT endpoints.

26.14.7 High-speed OTG device all-endpoint interrupt mask register (OTG_HS1_DAEPIMASK)

Offset address: 0x81C

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	AINM	R/W	All IN Endpoint Interrupts Mask No. X bit indicates interrupt mask of IN endpoint X. Up to 16 IN endpoints. 0: Mask 1: Interrupt
31:16	AOUTM	R/W	All OUT Endpoint Interrupts Mask No. X bit indicates interrupt mask of OUT endpoint (X-16). Up to 16 OUT endpoints. 0: Mask 1: Interrupt

26.14.8 High-speed OTG device V_{BUS} release time register (OTG_HS1_DVBUSDTIM)

Offset address: 0x828

Reset value: 0x0000 17D7

Field	Name	R/W	Description
15:0	VBUSDTIM	R/W	Device V _{BUS} Discharge Time The value of this bit is the V _{BUS} discharge time after the pulse is sent out during SRP. Value=Discharge time of V _{BUS} (number of PHY clock)/1024
31:16	Reserved		

26.14.9 High-speed OTG device V_{BUS} pulse time register (OTG_HS1_DVBUSPTIM)

Offset address: 0x82C

Reset value: 0x0000 05B8

Field	Name	R/W	Description
11:0	VBUSPTIM	R/W	Device V _{BUS} Pulsing Time The value of this bit is the v _{BUS} pulse time during SRP. Value=Discharge time of V _{BUS} (number of PHY clock)/1024

Field	Name	R/W	Description
31:12	Reserved		

26.14.10 High-speed OTG device threshold control register (OTG_HS1_DTHCTRL)

Offset address: 0x830

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	NSINTHEN	R/W	Nonisochronous IN Endpoints Threshold Enable 0: Disable 1: Enable
1	SINTHEN	R/W	Isochronous IN Endpoint Threshold Enable 0: Disable 1: Enable
10:2	TXTHLTH	R/W	Transmit Threshold Length This bit indicates the size of the transmission threshold, in double words, with a minimum value of 8 double words.
15:11	Reserved		
16	RXTHEN	R/W	Receive Threshold Enable 0: Disable 1: Enable
25:17	RXTHLTH	R/W	Receive Threshold Length This bit indicates the size of the receiving threshold, in double words, with a minimum value of 8 double words.
26	Reserved		
27	APARKEN	R/W	Arbiter Parking Enable 0: Disable 1: Enable
31:28	Reserved		

26.14.11 High-speed OTG device IN port FIFO empty interrupt mask register (OTG_HS1_DIEIMASK)

Offset address: 0x834

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	INEM	R/W	IN Endpoint Tx FIFO Empty Interrupt Mask Bit X indicates masking the interrupt of TXFEM (in OTG_HS1_DIEPINTx register) of IN endpoint X. Up to 16. 0: Mask 1: Interrupt
31:16	Reserved		

26.14.12 High-speed OTG device single-endpoint interrupt register (OTG_HS1_DEPINT)

Offset address: 0x838

Reset value: 0x0000 0000

Field	Name	R/W	Description
0			Reserved
1	IN1INT	R/W	In Endpoint 1 Interrupt
16:2			Reserved
17	OUT1INT	R/W	OUT Endpoint 1 Interrupt
31:18			Reserved

26.14.13 High-speed OTG device single-endpoint interrupt mask register (OTG_HS1_DEPIMASK)

Offset address: 0x83C

Reset value: 0x0000 0000

Field	Name	R/W	Description
0			Reserved
1	IN1M	R/W	In Endpoint 1 Interrupt Mask
16:2			Reserved
17	OUT1M	R/W	OUT Endpoint 1 Interrupt Mask
31:18			Reserved

26.14.14 High-speed OTG device IN endpoint 1 interrupt mask register (OTG_HS1_DIN1IMASK)

Offset address: 0x844

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSFCMPM	R/W	Transfer Completed Interrupt Mask 0: Mask 1: Interrupt
1	EPDISM	R/W	Endpoint Disable Interrupt Mask 0: Mask 1: Interrupt
2			Reserved

31	EPEN	R/S	<p>Endpoint Enable</p> <p>After this bit is set to 1, the endpoint will start to transmit data. When any of the following interrupts is triggered, this bit will be cleared to 0:</p> <ul style="list-style-type: none"> SETUP completed Disable endpoint Transmission completed

26.14.17 High-speed OTG device IN endpoint x interrupt register (OTG_HS1_DIEPINTx) (x=0~7, endpoint number)

Offset address: 0x908+0x20m; m=0~7

Reset value: 0x0000 0080

Read this register when ONEP bit of OTG_HS1_GCINT register is set to 1;
 Read OTG_HS1_DAEPINT register to obtain the accurate endpoint number of the device endpoint x interrupt register, and then read the register; only when the corresponding bit of the register is cleared to 0, can the corresponding bit of OTG_HS1_DAEPINT register and OTG_HS1_GCINT register be cleared to 0.

Field	Name	R/W	Description
0	TSFEMP	RC_W1	Transfer Complete Interrupt This bit indicates that the transmission on the endpoint has been completed.
1	EPDIS	RC_W1	Endpoint Interrupt Disable This bit means that the endpoint is disabled.
2	Reserved		
3	TO	RC_W1	Timeout Interrupt This bit is only applicable to the control IN endpoints, indicating that the response to the recently received IN token has timed out.
4	ITXEMP	RC_W1	Receive IN Token Interrupt when FIFO is empty This bit is only applicable to non-periodic IN endpoints, indicating that IN token is received when the corresponding TXFIFO of the endpoint is empty.
5	Reserved		
6	IEPNAKE	RC_W1	IN Endpoint NAK Effective This bit indicates that the module samples NAK, namely, the NAK bit of the IN endpoint has taken effect. This bit will be cleared to 0 when NAKCLR bit of OTG_HS1_DIEPCTRLx register is written.
7	TXFE	R	TXFIFO Empty Interrupt An interrupt will be generated when TXFIFO of this endpoint is empty.
8	TXFUDR		TXFIFO Underrun An interrupt will be generated when TXFIFO underrun is detected.
9	BUFFNA		Buffer Not Available Interrupt When the descriptor cannot be processed by the module, the buffer is unavailable, and an interrupt will be generated.
10	Reserved		
11	PDROFLG		Packet Dropped Flag This bit indicates that an ISOC OUT data packet is discarded without interrupt.
12	BERR		Babble Error Interrupt
13	NAK		NAK Interrupt This interrupt can be generated in two situations: <ul style="list-style-type: none"> ● The device transmits/receives NAK ● The synchronous IN endpoint transmits the data packet with 0 length

Field	Name	R/W	Description
31:14			Reserved

26.14.18 High-speed OTG device IN endpoint 0 transmission size register (OTG_HS1_DIEPTRS0)

Offset address: 0x910

Reset value: 0x0000 0000

This register can be modified only after EPEN bit of OTG_HS1_DIEPCTRL0 register is set to 1; this register can be read only after EPEN bit of OTG_HS1_DIEPCTRL0 register is cleared to 0.

Field	Name	R/W	Description
6:0	EPTRS	R/W	Endpoint Transfer Size This bit indicates the data size contained by endpoint 0 in one data transmission.
18:7			Reserved
20:19	EPPCNT	R/W	Endpoint Packet Count This bit indicates the number of data packets contained by endpoint 0 in one data transmission.
31:21			Reserved

26.14.19 High-speed OTG device IN endpoint x transmission size register (OTG_HS1_DIEPTRSx) (x=1~3, endpoint number)

Offset address: 0x910+0x20m; m=1~3

Reset value: 0x0000 0000

This register can be modified only after EPEN bit of OTG_HS1_DIEPCTRLx register is set to 1; this register can be read only after EPENA bit of OTG_HS1_DIEPCTRLx register is cleared to 0

Field	Name	R/W	Description
18:0	EPTRS	R/W	Endpoint Transfer Size This bit indicates the data size contained by endpoint x in one data transmission (in byte).
28:19	EPPCNT	R/W	Endpoint Packet Count This bit indicates the number of data packets contained by endpoint x in one data transmission.
30:29	TXDSEL	R/W	Transmit Packet Select <ul style="list-style-type: none"> For periodic IN endpoints, this bit indicates the number of data packets that must be transmitted per frame on USB. For the calculation synchronization IN endpoint, this bit calculates the data PID of the endpoint. 01: 1 10: 2 11: 3
31			Reserved

26.14.20 High-speed OTG device IN endpoint x DMA address register (OTG_HS1_DIEPDMAx) (x=1~5, endpoint number)

Offset address: 0x914+0x20m; m=1~5

Reset value: 0xXXXX XXXX

Field	Name	R/W	Description
31:0	DMAADDR	R/W	DMA Address This bit indicates the start address of external storage, and is used to store or obtain the endpoint data

26.14.21 High-speed OTG device IN endpoint x TXFIFO state register (OTG_HS1_DITXFSTx) (x=0~5, endpoint number)

Offset address: 0x918+0x20m; m=0~5

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	INEPTXFSA	R	IN Endpoint TXFIFO Space Available This bit indicates the available space of the IN endpoint TXFIFO (in word). 0x0: IN endpoint TXFIFO is full 0x1: 1 word 0x2: 2 words 0xn: n words are available (0<n<512) Other value: Reserved
31:16	Reserved		

26.14.22 High-speed OTG device OUT endpoint 0 control register (OTG_HS1_DOEPCTRL0)

Offset address: 0xB00

Reset value: 0x0000 8000

Field	Name	R/W	Description
1:0	MAXPS	R/W	Maximum Packet Size The same as the maximum data packet size of IN endpoint 0 00: 64 bytes 01: 32 bytes 10: 16 bytes 11: 8 bytes
14:2	Reserved		
15	USBAEP	R/W	USB Active Endpoint When this bit is set to 1, it indicates that the current configuration and the endpoint 0 are activated.
16	Reserved		
17	NAKSTS	R	NAK Status 0: The module replies non-NAK handshake signal according to the FIFO state 1: The module replies the NAK handshake signal on this endpoint. At this time, even if there is space in RXFIFO, the module will still stop receiving data.

Field	Name	R/W	Description
19:18	EPTYPE	R/W	Endpoint Type This bit is set to 00 by hardware, indicating control type of the endpoint.
20	SNMEN	R/W	Snoop Mode Enable In snoop mode, the correctness of OUT data packets is not checked before they are transmitted to the storage area.
21	STALLH	RS	STALL Handshake The program can only set this bit to 1 and when the endpoint receives the SETUP token, this bit will be cleared to 0. The priority of STALL is higher than that of NAK.
25:22	Reserved		
26	NAKCLR	W	NAK Clear When performing write operation to this bit, the NAK bit of the endpoint will be cleared to 0.
27	NAKSET	W	NAK Set When performing write operation to this bit, the NAK bit will be set to 1.
29:28	Reserved		
30	EPDIS	R	Endpoint Disable The control OUT endpoint 0 cannot be disabled.
31	EPEN	W	Endpoint Enable After this bit is set to 1, start to transmit data on the endpoint. When any of the following interrupts is triggered, this bit will be cleared to 0: <ul style="list-style-type: none"> ● Complete SETUP ● Disable endpoint ● Complete transmission

26.14.23 High-speed OTG device OUT endpoint x control register (OTG_HS1_DOEPCTRLx) (x=1~3, endpoint number)

Offset address: 0xB00+0x20m; m=1~3

Reset value: 0x0000 0000

Field	Name	R/W	Description
10:0	MAXPS	R/W	Maximum Packet Size This bit indicates the maximum data packet size of endpoint.
14:11	Reserved		
15	USBAEP	R/W	USB Active Endpoint When this bit is set to 1, it indicates that the current configuration and the endpoint 0 are activated.
16	EOF	R	Even Odd Frame This bit is used to indicate the frame number transmitted/received by the endpoint (for synchronization IN) or the PID of data packet (for interrupt/batch IN). Used for synchronous IN endpoints: 0: Even frame

Field	Name	R/W	Description
			1: Odd frame Endpoint Data PID Used for interrupt/batch IN endpoints: 0: DATA0 1: DATA1
17	NAKSTS	R	NAK Status 0: The module replies non-NAK handshake according to the FIFO state 1: The module replies the NAK handshake signal on this endpoint. At this time, for OUT endpoint, even if there is remaining space in RXFIFO, the module will still stop receiving data Note: The module always responds to the SETUP data packet through ACK handshake.
19:18	EPTYPE	R/W	Endpoint Type 00: Control 01: Synchronous 10: Batch 11: Interrupt
20	SNMEN	R/W	Snoop Mode Enable In snoop mode, the correctness of OUT data packets is not checked before they are transmitted to the storage area.
21	STALLH	RW/RS	STALL Handshake <ul style="list-style-type: none"> For uncontrolled and non-synchronous IN endpoints (read/write mode is RW): When this bit is set to 1, the device will reply STALL to all tokens from the USB host. This bit can only be cleared to 0 by software. Used for control endpoints (read/write mode is RW) When this bit is set to 1, it means that the module receives SETUP token.
25:22	Reserved		
26	NAKCLR	W	NAK Clear When performing write operation to this bit, the NAK bit of the endpoint will be cleared to 0.
27	NAKSET	W	NAK Set When performing write operation to this bit, the NAK bit of the endpoint will be set to 1. This bit can control the transmission of NAK handshake signal.
28	DPIDSET	W	DATA0 PID Set <ul style="list-style-type: none"> Used for interrupt/batch IN endpoints: When performing write operation to this bit, PID will be set to DATA0. Even Frame Set <ul style="list-style-type: none"> Used for synchronous IN endpoints: When performing write operation to this bit, EOF will be set to even frame.

Field	Name	R/W	Description
29	OFSET	W	Odd Frame Set When performing write operation to this bit, EOF bit of synchronous OUT endpoint will be set to odd frame.
30	EPDIS	R/S	Endpoint Disable Data transmission on the endpoint can be stopped by setting this bit to 1. This bit needs to be cleared to 0 before the endpoint disable interrupt bit is set to 1; this bit can only be set to 1 after EPEN is set to 1.
31	EPEN	R/S	Endpoint Enable After this bit is set to 1, the endpoint will start to transmit data. When any of the following interrupts is triggered, this bit will be cleared to 0: <ul style="list-style-type: none"> ● SETUP completed ● Disable endpoint ● Transmission completed

26.14.24 High-speed OTG device OUT endpoint x interrupt register (OTG_HS1_DOEPINTx) (x=0~7, endpoint number)

Offset address: 0xB08+0x20m; m=0~7

Reset value: 0x0000 0080

OTG_HS1_ Read this register when ONEP bit of GCINT register is set to 1; Read OTG_HS1_DAEPINTx register to obtain the accurate endpoint number of the device endpoint x interrupt register, and then read the register; only when the corresponding bit of the register is cleared to 0, can the corresponding bit of OTH_HS1_DAEPINT register and OTG_HS1_GCINT register be cleared to 0.

Field	Name	R/W	Description
0	TSFCMP	RC_W1	Transfer Complete Interrupt This bit indicates that the transmission on the endpoint has been completed.
1	EPDIS	RC_W1	Endpoint Interrupt Disable This bit means that the endpoint is disabled.
2	Reserved		
3	SETPCMP	RC_W1	SETUP Phase Complete Interrupt This bit is only applicable to the control OUT endpoint, indicating that the SETUP phase has been completed. After an interrupt is generated, the received SETUP data can be decoded.
4	RXOTDIS	RC_W1	Receive OUT Token Disable Interrupt This bit is only applicable to the control OUT endpoint, indicating that the OUT token is received without enabling the endpoint.
5	Reserved		
6	RXBSP	RC_W1	Receive Back-to-Back SETUP Packet Interrupt This bit is only applicable to the control OUT endpoint, indicating that the endpoint has received more than three consecutive SETUP data packets.

Field	Name	R/W	Description
13:7	Reserved		
14	NYET	RC_W1	NYET Interrupt When the non-synchronous OUT endpoint responds to the NYET handshake signal, the interrupt will be generated.
31:15	Reserved		

26.14.25 High-speed OTG device OUT endpoint 0 transmission size register (OTG_HS1_DOEPTR0)

Offset address: 0xB10

Reset value: 0x0000 0000

This register can be modified only after EPEN bit of OTG_HS1_DOEPCTRL0 register is set to 1; this register can be read only after EPEN bit of OTG_HS1_DOEPCTRL0 register is cleared to 0.

Field	Name	R/W	Description
6:0	EPTRS	R/W	Endpoint Transfer Size This bit indicates the data size contained by endpoint 0 in one data transmission (in byte).
18:7	Reserved		
19	EPPCNT	R/W	Endpoint Packet Count This bit will decrease to 0 after RXFIFO is written to a data packet.
28:20	Reserved		
30:29	SPCNT	R/W	SETUP Packet Count These bits indicate the number of SETUP dat packets that can be received continuously 01: 1 10: 2 11: 3
31	Reserved		

26.14.26 High-speed OTG device OUT endpoint x transmission size register (OTG_HS1_DOEPTRx) (x=1~5, endpoint number)

Offset address: 0xB10+0x20m; m=1~5

Reset value: 0x0000 0000

This register can be modified only after EPEN bit of OTG_HS1_DOEPCTRLx register is set to 1; this register can be read only after EPEN bit of OTG_HS1_DOEPCTRLx register is cleared to 0

Field	Name	R/W	Description
18:0	EPTRS	R/W	Endpoint Transfer Size This bit indicates the data size contained by endpoint x in one data transmission (in byte).

Field	Name	R/W	Description
28:19	EPPCNT	R/W	Endpoint Packet Count This bit indicates the number of data packets contained by endpoint x in one data transmission.
30:29	PID_SPCNT	R/W	Receive Data PID or SETUP Packet Count <ul style="list-style-type: none"> For synchronous OUT endpoints, this bit indicates the PID of the last received data packet. 00: DATA0 01: DATA2 10: DATA1 11: MDATA For the control OUT endpoint, this bit indicates the number of SETUP data packets that the endpoint can continuously receive. 01: 1 10: 2 11: 3
31	Reserved		

26.14.27 High-speed OTG device OUT endpoint x DMA address register (OTG_HS1_DOEPDMAx) (x=1~5, endpoint number)

Offset address: 0xB14+0x20m; m=1~5

Reset value: 0XXXXX XXXX

Field	Name	R/W	Description

31:1	Reserved		

26.17.6 Transmit bit stuff enable register (TXBITSTUFFENABLE)

Offset address: 0x214

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	txbitstufferenable	R/W	TX Bit Stuff Enable Indicates if the DATA_OUT[7:0] lines needs to be bit stuffed or not. 0: Disable 1: Enable
31:1	Reserved		

26.17.7 Debounce filter bypass enable register (USB_DBNCE_FLTR_BYPASS)

Offset address: 0x238

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	usb_dbnce_fltr_bypass	R/W	Bypass debounce filters for avalid, bvalid, vbusvalid, sessend, iddig signals when enabled. 0: Disable 1: Enable
31:1	Reserved		

27 Ethernet

27.1 Introduction

Ethernet provides configurable and flexible peripherals to meet various application requirements of customers. It supports two industry standard interfaces connected to the external physical layer: MII and RMI are used by default, and MII is only defined in IEEE 802.3 specification. It has many application fields, such as switch, network interface card and so on. Ethernet can transmit and receive data according to IEEE 802.3-2002 standard with the help of peripherals.

Ethernet complies with the following standards:

- IEEE802.3-2002 for Ethernet MAC
- IEEE1588-2008 standards which specify synchronization precision of networked clock
- AMBA 2.0 for AHB master/slave ports
- RMII specification of RMII Alliance

27.2 Main characteristics of Ethernet

27.2.1 Main characteristics of MAC

- (1) MII interface and PHY communication that conforms to IEEE802.3 specification
- (2) Support 10/100Mbps data transmission rate

- (3) Half-duplex operation
 - Support CSMA/CD protocol
 - Provide back pressure flow control
- (4) Full-duplex operation
 - Support IEEE 802.3x flow control
 - If the flow control input signal disappears, the zero-range pause frame will be automatically transmitted
 - The received pause frame can be forwarded to the user application program
- (5) Insertion of frame data (SFD) in transmit path, and header and frame start data deleted in receive path
- (6) Automatically generate CRC and pad, which can be automatically cleared when receiving frames
- (7) Programmable frame interval
- (8) Programmable frame length; it supports up to 16KB jumbo frame
- (9) Address filter mode
 - Four 48-bit DA address registers; each byte can be masked
 - Three 48-bit SA address registers; each byte can be masked
 - 64-bit Hash filter, applicable to multicast and unicast addresses
 - Can transmit multi-cast address frames
 - Support mixed mode, and can transmit all frames, with network monitoring not filtered
 - A state report will be attached when transmitting incoming data packets
- (10) Independent transmitting, receiving and control interface
- (11) 32-bit data transmitting interface and receiving interface
- (12) Conduct IEEE 802.1Q VLAN variable detection for received frames
- (13) MDIO main interface (optional), used for PHY device configuration and management
- (14) Conduct forced network statistics through RMON/MIB counter
- (15) Detect LAN wake-up frame and AMD Magic Packet™ frame
- (16) Support Ethernet frame timestamp, and each frame gives 64-bit timestamp
- (17) 2KB transmit FIFO of programmable threshold function and 2KB receive FIFO of configurable threshold function

- (18) During multi-frame storage of the receive FIFO, the receiving state vector is inserted into the receive FIFO after EOF transmission, so that the receiving state of these frames will not be stored by the receive FIFO
- (19) In storage and forwarding mode, all error frames will be filtered in receiving process and not be forwarded to the application program
- (20) Generate pulses for lost or damaged frames in the receive FIFO to support data statistics
- (21) Select to forward good frames of small size
- (22) In enhanced receiving, IPv4 header checksum and TCP, UDP or ICMP checksum encapsulated in IPv4 or IPv6 data packets can be checked
- (23) The checksum unloads the received IPv4 and TCP data packets encapsulated by Ethernet frames
- (24) Storage and forwarding mechanism transmitted to MAC
- (25) The pause frame control or back pressure signal to be transmitted to the MAC core is automatically generated according to the receive FIFO filling level
- (26) Handle automatic retransmission of conflict frames during transmission
- (27) Discard frames under excessive collision, delay collision, excessive delay and underflow conditions
- (28) Control and refresh Tx FIFO through software
- (29) Calculate IPv4 header checksum and TCP, UDP or ICMP checksum and insert the frames transmitted in storage and forwarding mode
- (30) Internal loopback through MII during debugging

27.2.2 Main characteristics of PTP

- (1) Timestamp of transmitting and receiving frames
- (2) Coarse calibration and precision calibration
- (3) An interrupt will be triggered when the system time is greater than the target time
- (4) Output second pulse

27.2.3 Main characteristics of DMA

- (1) AHB burst type can be selected at the AHB main interface
- (2) Select address alignment burst from AHB master port
- (3) AHB slave interface supports all AHB burst types

- (4) Double-buffer (buffering ring) or linked list (chain) descriptor link
- (5) Byte aligned addressing supported by data buffer
- (6) Optimize packet-oriented DMA transmission
- (7) Descriptor architecture, which allows transmission of large data blocks with minimal CPU intervention (each descriptor can transmit up to 8KB data)
- (8) Comprehensive state when reporting normal operation and transmission errors
- (9) Size of single programmable burst for transmitting and receiving DMA engine, for optimal host bus
- (10) Programmable interrupt option
- (11) Control transmitting/receiving completion interrupt
- (12) Loop scheduling arbitration or fixed priority arbitration is adopted between the transmitting engine and the receiving engine
- (13) The current Tx/RX descriptor pointer and buffer pointer are used as state registers

27.3 Functional description

27.3.1 Multiplexing function mapping

The following table displays MAC signal and corresponding MII/RMII signal mapping.

Table 137 Multiplexing Function Mapping

Port	AF11
	ETH
PA0-WKUP	ETH_MII_CRS
PA1	ETH_MII_RX_CLK/ETH_RMII_REF_CLK
PA2	ETH_MDIO
PA3	ETH_MII_COL
PA7	ETH_MII_RX_DV/ETH_RMII_CRS_DV
PB0	ETH_MII_RXD2
PB1	ETH_MII_RXD3
PB5	ETH_PPS_OUT
PB8	ETH_MII_TXD3
PB10	ETH_MII_RX_ER

Port	AF11
	ETH
PB11	ETH_MII_TX_EN/ETH_RMII_TX_EN
PB12	ETH_MII_TXD0/ETH_RMII_TXD0
PB13	ETH_MII_TXD1/ETH_RMII_TXD1
PC1	ETH_MDC
PC2	ETH_MII_TXD2
PC3	ETH_MII_TX_CLK
PC4	ETH_MII_RXD0/ETH_RMII_RXD0
PC5	ETH_MII_RXD1/ETH_RMII_RXD1
PE2	ETH_MII_TXD3
PG8	ETH_PPS_OUT
PG11	ETH_MII_TX_EN/ETH_RMII_TX_EN
PG13	ETH_MII_TXD0/ETH_RMII_TXD0
PG14	ETH_MII_TXD1/ETH_RMII_TXD1

27.3.2 SMI, MII and RMII

Ethernet peripherals include MAC 802.3 with dedicated DMA controller. It supports MII and RMII used by default and switches them through select bit. It also includes SMI for communicating with external PHY. The mode and function of MAC controller and DMA controller can be selected through a configuration register.

When transmitting data, first transmit the data from the system memory to the TX FIFO buffer through DMA, and then transmit it through the MAC core. The Ethernet frame received through the line is stored by RX FIFO before it is transmitted to the system memory through DMA.

Note: When using Ethernet, the clock frequency of AHB shall be at least 25MHz.

27.3.2.1 Station management interface (SMI)

SMI supports accessing 32 PHY. The application program selects one PHY among the 32 PHY through the 2-wire clock and data line, and then accesses any PHY register. Only one register in one PHY can be addressed at any given time.

Both MDC clock line and MDIO data line are used as multiplexing function I/O in the microcontroller:

- MDC: Periodic clock, which provides reference timing when transmitting data at 2.5MHz. The minimum high/low-level time of MDC

is 160ns. The minimum cycle of MDC is 400ns. In idle state, the SMI management interface drives the MDC clock signal to low level.

- MDIO: Data input/output bit stream, which is used to synchronize the transmission state with PHY device through MDC clock signal.

SMI frame format

Table 138 Frame Format

Management frame format	
Header	Each operation can be started through the header field, and the header field is used to establish synchronization with the PHY device and corresponds to 32 consecutive logical "1" bits on the MDIO line and 32 cycles on the MDC.
Start	It is defined by the <01> mode, and used to verify transition of the state of the line from the default logic "1" - logic "0" - logic "1".
Operation	Define the type of ongoing operation.
PADDR	The PHY address has 5 bits, allowing 32 unique PHY addresses. The MSB bit of the address is the first to transmit and receive.
RADDR	The register address has 5 bits, and 32 different registers can be addressed in the selected PHY device. The MSB bit of the address is the first to transmit and receive.
TA	A 2-bit mode is defined between RADDR and DATA to avoid competition during read operation. When performing read operation, the MAC controller drives two bits of the TA to the high-impedance state on MDIO line. PHY device will drive the first bit of TA to high-impedance state and the second bit to "0". When write operation is performed, the MAC controller will drive the <10> mode for the TA. The PHY device drives two bits of TA to the high-impedance state.
Data	The data field is 16 bits. Bit 15 of the MAC_DATA register is the first bit.
Idle	MDIO line is driven to the high-impedance state. The three-state driver is disabled, and the pull-up resistance of PHY keeps the line in the logic "1" state.

SMI clock selection

Mac starts management read/write operation. SMI clock is a frequency division clock with AHB clock as clock source. The frequency division factor depends on the clock range set in MAC_ADDR register.

Table 139 Clock Range

CR bit	HCLK clock	MDC clock
000	60-100MHz	AHB clock/42
001	100-150MHz	AHB clock/62
010	20-35MHz	AHB clock/16
011	35-60MHz	AHB clock/26
100	150-180MHz	AHB clock/102
101、110、111	Reserved	-

SMI write operation

When MB bit and MW bit of MAC_ADDR are set to 1 by application program, SMI will trigger write operation of PHY register by transmitting PHY address, and register address in PHY, and writing data. When performing write operation, the application program cannot modify MAC_ADDR and MAC_DATA registers. After write operation is completed, SMI will reset MB bit.

SMI read operation

When MB bit of MAC_ADDR is set and MW bit is cleared to zero, SMI will trigger read operation of PHY register by transmitting PHY address, and register address in PHY. When performing read operation, the application program cannot modify MAC_ADDR and MAC_DATA registers. After read operation is completed, SMI will reset MB bit, and update the read data from PHY to MAC_DATA register.

27.3.2.2 Media independent interface (MII)

MII defines the interconnection between MAC sublayer and PHY at data transmission rate of 10 Mbit/s and 100 Mbit/s.

The signals are as follows:

- (1) MII_TX_EN: Transmit enable signal; MAC is currently transmitting half byte for MII
- (2) MII_RX_DV: Data receiving effective signal; PHY is currently receiving recovered and decoded half byte of MII
- (3) MII_TXD [3:0]: Data transmitting signal
- (4) MII_RXD [3:0]: Data receiving signal
- (5) MII_RX_ER: Receiving error signal
- (6) MII_TX_CLK: Continuous clock signal, providing reference timing for TX data transmission
- (7) MII_RX_CLK: Continuous clock signal, providing reference timing for RX data transmission
- (8) MII_CRS: Carrier sense signal
- (9) MII_COL: Conflict detection signal

Table 140 TX Interface Signal Encoding

MII_TX_EN	MII_TXD [3:0]	Description
0	0000-1111	Normal frame internal
1	0000-1111	Normal data transmission

Table 141 RX Interface Signal Encoding

MII_RX_DV	MII_RX_ER	MII_RXD [3:0]	Description
0	0	0000-1111	Normal frame internal
0	1	0000	Normal frame internal
0	1	0001-1101	Reserved
0	1	1110	Error carrier detection
0	1	1111	Reserved
1	0	0000-1111	Normal data receiving
1	1	0000-1111	Data receiving error

MII clock source

TX_CLK and RX_CLK clock signal can take effect only when 25MHz clock is provided to external PHY, and this signal can be output through MCO pin. The required frequency can be obtained on MCO pin through 25 MHz external quartz crystal only when PLL frequency doubling is configured.

27.3.2.3 Reduced media independent interface (RMII)

RMII reduces the number of pins of MCU of Ethernet peripherals and external PHY at 10/100Mbit/s. According to IEEE 802.3u standard, MII has 16 data and control signal pins. RMII reduces the number of pins to 7.

RMII is instantiated between MAC and PHY. It is conducive to converting MII of MAC to RMII. RMII has the following characteristics:

- (1) Separate 2-bit wide transmitting and receiving data path
- (2) 10-Mbit/s and 100-Mbit/s running speed
- (3) The reference clock is 50MHz
- (4) Provide the same reference clock to MAC and external Ethernet PHY from the outside

RMII clock source

Use external 50MHz clock or embedded PLL to generate 50MHz-frequency signal to drive PHY.

27.3.2.4 MII/RMII selection

When the Ethernet controller is not in reset mode or the clock is enabled, the application program needs to set MII/RMII mode.

27.3.3 Media access control (MAC 802.3)

The access method of IEEE 802.3 international standard applicable to LAN is

CSMA/CD. The Ethernet peripheral consists of one MAC 802.3 controller with MII and a dedicated DMA controller.

- (1) The following system uses LAN CSMA/CD sublayer
 - Support half-duplex and full-duplex
 - The conflict detection access method is applicable only to half-duplex
 - The data rate of baseband system and broadband system is 10 Mbit/s and 100Mbit/s
 - Support MAC to control frame sublayer
- (2) Functions of MAC sublayer
 - Data encapsulation
 - Framing
 - Addressing
 - Error detection
 - Media access management
 - Media distribution
 - Contention resolution
- (3) Working mode of MAC sublayer
 - Half-duplex: Contention for physical media with CSMA/CD algorithm
 - Full duplex: When the physical media supports synchronous transmission and receiving, and two full-duplex stations are connected to the LAN, data can be transmitted and received at the same time without solving the contention problem.

27.3.3.1 MAC 802.3 frame format

IEEE 802.3-2002 standard specifies MAC uses MAC sublayer and optional MAC control sublayer (10/100 Mbit/s).

- (1) Two frame formats are specified for data communication system using CSMA/CD MAC
 - Basic MAC frame format
 - Tagged MAC frame format
- (2) Frame structure of field
 - Header: 7 bytes, used for synchronization
 - Start frame delimiter: 1 byte, indicating the start of the frame
 - Destination address and source address: MAC address field (6 bytes), indicating the address of destination station and source station
- (3) Address assignment is based on the following types
 - Single address: The physical address related to THE special station in the network.
 - Group address: A multi-destination address related to one or more stations in a given network. There are two kinds of multicast addresses, namely, multicast group address and broadcast address.

- QTag prefix: A 4-byte field inserted in the source address and MAC client length/type field. This field is an extension of the basic frame (untagged) to obtain the tagged MAC frame. There is no untagged MAC frame.
- Data and PAD: n bytes; the data are completely transparent, which means that any number of bytes may appear in data field. If PAD exists, its size is decided by the data size.
- MAC client length/type: 2 bytes, which have different meanings.
- Frame inspection sequence: 4 bytes including CRC value. CRC calculation is based on the following fields: source address, destination address, QTag prefix, length/type, LLC data and PAD.

27.3.3.2 MAC frame transmission

All operations when DMA controls transmission. DMA pushes the data read from system memory into FIFO. Then the frame will pop up and be transmitted to MAC core. When frame transmission is over, the transmission state will be obtained from MAC core and sent back to DMA. The FIFO fill level is indicated to the DMA to initiate data acquisition in the required system memory burst by using the AHB interface. The data from AHB main interface will be pushed to FIFO. The depth of transmit FIFO is 2KB

Transmit protocol

MAC controls transmission of Ethernet frame. The following functions are implemented to meet IEEE 802.3/802.3z specification:

- Generate header and SFD
- Generate transmitted frame state
- Generate blocking signals in half-duplex mode
- Control the flow (back pressure) in half-duplex mode
- Control Jabber timeout
- Including timestamp snapshot logic that conforms to IEEE 1588

Transmit CRC: Automatic generation of CRC and pad

In order to meet the minimum data field requirements of IEEE 802.3, when the number of bytes received from the application program is less than 60, zero will be attached to the transmitted frame to make the data length become 46 bytes. MAC can set not adding filling value. Calculate the CRC of the FCS field and attach it to the data being transmitted. If MAC is set to not attach the CRC value to the end of the Ethernet frame, the CRC will not be transmitted. However, when MAC is set to attach filling to the frame less than 60 bytes, CRC will be attached to the end of the filling frame.

Transmit data packets

Transmission of data packets contains transmission of single data packet and

multiple data packets, and their operation mode is different.

Transmit scheduler

MAC is responsible for scheduling the frame transmission on MII. The interval between two transmitted frames can be maintained, and the truncated binary exponential rollback algorithm can be observed in half-duplex mode. MAC enables transmission after meeting IFG counter and rollback delay conditions.

Transmit flow control

In full-duplex mode, when `MAC_FCTRL[TXFCTRLLEN]=1`, MAC will generate pause frame and transmit it when needed. The pause frame and CRC are transmitted together. Generation of the pause frame can be enabled in two ways. When the application program sets `FCTRLB` bit to 1 or the receive FIFO is full, the pause frame will be transmitted.

Transmit FIFO refresh

`FTXF` bit of `ETH_DMAOPMOD` register controls to clear the transmit FIFO. Even if Tx FIFO is transmitting the frame to MAC core, Tx FIFO and the corresponding pointer will be immediately cleared to the initial state, as a result, an underrun event will be generated to MAC transmitter, and the frame transmission will be terminated. The state of the frame will mark both the underrun event and the frame emptying event.

Transmit status word

After the Ethernet frame is transmitted to the MAC core and the core completes the transmission of the frame, the transmission state will be provided to the application program.

Transmit checksum offload

The communication protocol realizes the checksum field, which helps understanding the integrity of data transmitted through the network. Because encapsulating TCP and UDP on IP datagrams is the most wide application of the Ethernet, the Ethernet controller has the function of transmitting checksum offload, and this function supports checksum calculation and insertion in the transmitting path, and error detection in the receiving path.

Retransmitting during conflict

In half-duplex mode, when transmitting frames to MAC, collision event may occur on the MAC line interface. The MAC may even indicate retrying before finishing receiving the frame. Then the frame will be retransmitted and pop up from the FIFO again.

MII/RMII

Each half byte from MII is transmitted on RMII, double bits are transmitted at one time, and the transmitting order is from low to high.

27.3.3.3 MAC frame receiving

The MAC pushes the received frame into the Rx FIFO. Once the state of this FIFO exceeds the configured receiving threshold, it will be indicated to DMA so that DMA can initiate preconfigured burst transmission to AHB interface.

Receive protocol

When a frame is received, the header and SFD of the frame will be removed. When SFD is detected, MAC will transmit Ethernet frame data to RX FIFO, which starts from the first byte after SFD. After the IEEE 1588 timestamp function is enabled, once an SFD is detected on the MII, a snapshot of the system time will be obtained. This timestamp will be transmitted to the application program, unless the MAC filters and discards the frame.

Receive multiple frames

Since the state is available immediately after receiving the data, the frames can be stored as long as the FIFO is not full.

Receive CRC: Automatic CRC and pad removal

The MAC will check the CRC error in the received frame and calculate the 32-bit CRC in it. No matter whether the pad/CRC is automatically removed, the Mac will receive the whole frame to calculate the CRC check of the received frame.

Received frame controller

When MAC_FRAF[RXA]=0, MAC will perform frame filtering according to the destination address and source address. If filtering fails, the frame will be discarded and not be transmitted to the application program. When the filtering parameters change dynamically, the filtering fails, the remaining frames will be discarded and the receive status word will be updated immediately. In Ethernet power-down mode, all received frames will be discarded and not be forwarded to the application program.

Receive checksum offload

The IPC bit in the MAC_CFG register controls the receive checksum offload. This function is to detect and process IPv4 and IPv6 frames in received Ethernet frame to ensure data integrity. The MAC identifies IPv4 or IPv6 frames by checking the type field of the received Ethernet frame. This identification

method is also applicable to frames with VLAN tag.

Receive flow control

MAC_FCTRL[RXFCTRLLEN] controls the detection function of pause frame. When this bit is set, the MAC will detect the receiving pause frame and the frame transmission will pause. The specific time is determined by the delay set in the received pause frame. After the flow control is enabled, start to monitor whether the destination address of the received frame matches the multicast address of the control frame. If they match, the MAC will determine whether to transmit the received control frame to the application program according to the MAC_FRAF[PCTRLF] bit.

Error processing

Table 142 Error Handling Situation

Occurrence	Processing results
Rx FIFO has been full before EOF data is received from MAC.	Discard the entire frame, and the overrun counter in the ETH_DMAMFABOCNT register increases.
Use FERRF and FUF bits in the ETH_DMAOPMOD register to enable the corresponding functions.	Rx FIFO can filter error frames and too small frames.
Configure the receive FIFO to work in storage and forwarding mode.	Filter and discard all error frames.
In pass-through mode, if the SOF of the frame is read from Rx FIFO, the state and length of the frame are available.	The whole error frame can be discarded. DMA can empty the error frame being read from FIFO. Then stop the data transmission to DMA, read from the inside and discard the remaining frames. If available, transmission of next frame can be started.

Receive status word

At the end of Ethernet frame receiving, MAC will output the receiving state to DMA. The detailed description of receiving state is the same as RXDES0[31:0].

Frame length interface

The data transmission and receiving between the application and the MAC are conducted in the form of transmitting a complete frame. The application layer needs to know the length of the frame received from the inbound port in order to transmit the frame to the outbound port. The MAC core provides the length of each received frame at the end of receiving of each frame.

MII/RMII receive bit sequence

Each half byte is transmitted from the two bits received on RMII to MII, and the transmitting order is from low to high.

27.3.3.4 MAC interrupt

Various events can generate an interrupt to the MAC core, and the MAC_ISTS register describes various event interrupts. Setting the corresponding mask bit in the interrupt mask register can prevent event interrupts from being generated. The interrupt can be cleared by reading the corresponding state register and other registers.

27.3.3.5 MAC filtering

Address filtering

Check the destination address and source address of all received frames and report the corresponding address filtering state. The address check depends on the setting of the frame filter register. The filtered frames can be identified: multicast frames or broadcast frames. Address filtering uses the MAC address of the station and the multi-broadcast list for address check.

Unicast destination address filtering

MAC supports 4 MAC addresses for unicast perfect filtering. If $MAC_FRAF[HUC]=0$, MAC will compare whether all 48 bits of the received unicast address match the set MAC address.

Multicast destination address filtering

The PM of MAC_FRAF register controls whether to set the MAC to pass all multicast frames. When the PM bit is reset, the HMC bit of the MAC_FRAF register controls the multicast address filtering.

Hash or perfect address filtering

When setting HPF bit, HUC bit and HMC bit of MAC_FRAF register, DA filter is configured to allow frames to pass when its DA matches hash filter or perfect filter. This configuration is applicable to unicast and multicast frames. If the HPF bit is reset, there is only one filtering method.

Broadcast address filtering

In the default mode, the MAC does not filter broadcast frames. However, if $MAC_FRAF[DISBF]=1$, all broadcast frames will be discarded.

Unicast source address filtering

The MAC performs perfect filtering according to the source address of the received frame. By default, the MAC compares the SA field with the value in the SA register. When Bit 30 in the corresponding register is set, the MAC address register will be configured to contain SA for comparison. If

MAC_FRAF[SAFEN]=0, the result of SA filtering will be presented in the status bit of the received status word. Otherwise, the MAC will discard the frames that do not pass SA filtering.

Reverse filtering

In the final output, the DAIF and SAIF bits of MAC_FRAF control the filtering of destination address and source address respectively. The DAIF bit is applicable to unicast and multicast Da frames. When this bit is set, the result of unicast/multicast destination address filtering will be reversed. When the SAIF bit is set, the result of unicast SA filtering will be reversed.

Table 143 Destination Address Filtering

Frame type	PR	HUC	HMC	DAIF	PM	DISBF	HPF	DA filtering operation
Broadcast	1	X	X	X	X	X	X	Pass
	0	X	X	X	X	0	X	Pass
	0	X	X	X	X	1	X	Fail
Unicast	1	X	X	X	X	X	X	All frames pass
	0	0	X	0	X	X	X	Pass when perfect/group filter matches
	0	0	X	1	X	X	X	Fail when perfect/group filter matches
	0	1	X	0	X	X	0	Pass when hash filter matches
	0	1	X	1	X	X	0	Fail when hash filter matches
	0	1	X	0	X	X	1	Pass when hash or perfect/group filter matches
	0	1	X	1	X	X	1	Fail when hash or perfect/group filter matches
Multicast	1	X	X	X	X	X	X	All frames pass
	X	X	X	X	1	X	X	All frames pass
	0	X	0	0	0	X	X	If PCTRLF=0x, pass when perfect/group filter matches, and discard the pause control frame
	0	X	1	0	0	X	0	If PCTRLF=0x, pass when hash filter matches, and discard the pause control frame
	0	X	1	0	0	X	1	If PCTRLF=0x, pass when hash or perfect/group filter matches, and discard the pause control frame
	0	X	0	1	0	X	X	If PCTRLF=0x, fail when perfect/group filter matches, and discard the pause control frame

Frame type	PR	HUC	HMC	DAIF	PM	DISBF	HPF	DA filtering operation
	0	X	1	1	0	X	0	If PCTRLF=0x, fail when hash filter matches, and discard the pause control frame
	0	X	1	1	0	X	1	If PCTRLF=0x, fail when hash or perfect/group filter matches, and discard the pause control frame

Table 144 Source Address Filtering

Frame type	PR	SAIF	SAFEN	SA filtering operation
Unicast	1	X	X	All frames pass
	0	0	0	Pass when perfect/group filter matches, but the pause control frame is not discarded
	0	1	0	Fail when perfect/group filter matches, but the frame is not discarded
	0	0	1	Pass when perfect/group filter matches, and discard the failed frames
	0	1	1	Fail when perfect/group filter matches, but the failed frames are not discarded

27.3.3.6 MAC loopback mode

MAC can loop back the received frames. This function is controlled by BM bit of MAC_CFG register, and it is disabled by default.

27.3.3.7 MAC management counter (MMC)

MMC has a control register, two interrupt state registers, and two mask interrupt registers to collect information about received frames and transmitted frames. These registers are accessible from the application program.

Receive the MMC counter and update the frames that have passed address filtering. The discarded frame will not be updated unless the discarded frame is a short frame less than 6 bytes.

Good frame

- (1) If there are no following errors during transmission, the transmitted frame is a “good frame”:
 - Frame underrun
 - No carrier/lost carrier
 - Jabber timeout
 - Delay conflict
 - Excessive delay
 - Excessive conflict

- (2) If there are no following errors during receiving, the received frame is a “good frame”:
 - Short frame
 - CRC error
 - MII_RXER input error
 - Alignment error (for 10/100Mb/s only)
 - Length error (for non-type frames only)
 - Out of range (for non-type frames only, exceeding the maximum size)
- (3) The frame type determines the maximum frame size as follows:
 - Maximum size of untagged frame=1518
 - Maximum size of VLAN frame=1522

27.3.3.8 Power management (PMT)

PMT supports receiving network remote wake-up frame and magic data packet frame. Interrupts can be generated for wake-up frames and magic data packet frames received by MAC. PMT module can be enabled by WKUPFEN bit and MPEN bit of MAC_PMTCTRLSTS register. When the power-down mode is enabled in the PMT, the MAC will discard all received frames and will not forward them to the application. The power-down mode will exit only when the remote wake-up frame or magic data packet frame is received and the corresponding detection is enabled.

Detect remote wake-up frame

When MAC is in sleep mode and MAC_PMTCTRLSTS[WKUPFEN]=1 is enabled, the MAC can resume normal work after receiving the remote wake-up frame.

Detect magic data packet

AMD Company's technology can be used to power on the devices which are in sleep mode on the network. MAC receives a specific information packet called magic data packet, and its address is the node on the network. Only the magic data packets that are transmitted to the device or multicast address are checked to determine whether they meet the wake-up requirements.

System precautions during power-down

When the EINT 19 interrupt line is enabled, the Ethernet PMT module can detect frames when the system is in stop mode. The MAC receiver state machine shall remain enabled in power-down mode.

27.3.3.9 Precision time protocol (IEEE 1588PTP)

The IEEE 1588 standard defines a protocol. It is suitable for systems that communicate through LAN supporting multicast message transmission and

synchronous heterogeneous systems, including clocks with different fixing accuracy, resolution and stability. It supports precision clock synchronization in measurement and control systems which are realized by technologies such as network communication, LAN computing and distributed objects. It supports system-level synchronization accuracy within the subsecond range, and requires minimal network and local clock computing resources. This protocol, called precision time protocol, is transmitted through UDP/IP. The system or network is divided into master node and slave node, which are used to allocate timing/clock information. The protocol synchronizes the slave node to the master node by exchanging PTP messages.

Use PTP to transmit frames

The timestamp is captured when the SFD of the frame is output on the MII. Each transmitted frame may be tagged to indicate whether there is need to capture the timestamp of this frame. PTP frames can be identified without processing the transmitted frame. Transmit the control bit control frame in the descriptor. The captured timestamp is returned to the application in a manner of providing the frame state. The timestamp will be transmitted back to the corresponding transmit descriptor along with the transmission state of the frame, so that the timestamp can be connected with the specific PTP frame. The 64-bit timestamp information is written back to the TXDES2 and TXDES3 fields, wherein TXDES2 maintains the 32 least significant bits of the timestamp.

Use PTP to receive frames

When the IEEE 1588 timestamp function is enabled, the timestamps of all frames received on the MII will be captured by the Ethernet MAC. The MAC provides the timestamp when the frame receiving is completed. The captured timestamp is returned to the application in a manner of providing the frame state. The timestamp will be transmitted back to the corresponding receive descriptor along with the receiving state of the frame. The 64-bit timestamp information is written back to the RXDES2 and RXDES3 fields, wherein RXDES2 maintains the 32 least significant bits of the timestamp.

Reference timing source

To take a time snapshot, the core needs a 64-bit reference time. PTP reference clock input is used to generate reference time and capture timestamp internally. The frequency of the generated reference clock cannot be less than the resolution of the timestamp counter. The synchronization precision target between the master node and each slave node is about 100ns.

Calibration method

Synchronizing or updating the system time in a process is the coarse calibration

method, and synchronizing or updating the system time in order to reduce the system time jitter is the precision calibration method.

System time calibration method

The 64-bit PTP time is refreshed by the PTP input reference clock HCLK. In order to obtain the timestamp of the Ethernet frame transmitted or received on the MII, this time is used as the clock source. The system time timer can be initialized or calibrated in coarse calibration or precision calibration method.

System time initialization

The timestamp function is controlled by TSEN bit of PTP_TSCTRL register. After setting, the timestamp can be enabled only by initializing the timestamp counter.

PTP trigger connected internally to TMR2

In order to avoid the uncertainty of command execution time caused by use of interrupt when the system time is greater than the target time, the PTP trigger output signal internally connected to TMR2 input trigger can be set to high level when the system time is greater than the target time.

PTP pulse per second output signal

PTP pulse is used to check the synchronization of all nodes in the network. Two clocks can be provided with pulses per second (PPS) output signals to test the difference between the local slave clock and the master reference clock. The pulse width of PPS output is 125ms.

27.3.4 DMA controller

DMA is used for packet data transmission. The controller can be set to generate CPU interrupt under normal/error conditions such as completion of transmitting frames and receiving frames. DMA has separate transmitter and receiver and corresponding control and state registers. The transmitter transmits the data in the system memory to Tx FIFO, and the receiver transmits the data received by Rx FIFO to the system memory. DMA descriptor can transmit data from the source address to the destination address with minimal CPU intervention. The communication mode between DMA and CPU falls into the following two data structures:

- Control and state register
- Descriptor list and data buffer

27.3.4.1 Host bus burst access

DMA attempts fixed-length burst transmission on the AHB main interface. The maximum length of the burst depends on the PBL bit of DMABMOD register.

The receive and transmit descriptors access the 16 bytes to be read with the maximum possible burst size.

27.3.4.2 Host data buffer alignment

The transmit and receive data buffers do not limit the start address alignment. In our system, the start address of the buffer can be aligned with any of the four bytes. DMA always starts transmission when the address is aligned with the bus width, and uses unnecessary byte channels to transmit empty data at the beginning or end of Ethernet frame transmission.

27.3.4.3 Calculate buffer size

DMA only updates the status of transmit and receive descriptors, not the size. The size needs to be calculated by the driver. Transmit DMA will transmit the correct number of bytes to the MAC core.

27.3.4.4 DMA arbiter

The arbiter in DMA arbitrates between the transmitting channel and the receiving channel accessing the AHB main interface respectively. Circular scheduling and fixed priority arbitration can be used.

27.3.4.5 Error response to DMA

If the slave gives an error response to the data transmission initiated by the DMA channel, the corresponding DMA will stop all operations and update the FBERRFLG bit and ERRB bit in ETH_DMASTS register.

27.3.4.6 Tx DMA

Tx DMA contains two modes: default mode and OSF mode

Process transmitted frames

The expected data buffer of transmit DMA contains a complete Ethernet frame, excluding header, pad and FCS. The DA, SA, and type/length fields contain valid data. When the transmit descriptor indicates that the MAC core disables the insertion of CRC or pad, the buffer must have a complete Ethernet frame containing CRC bytes. The frame is bounded by the first descriptor and the last descriptor, which can be a data link or across multiple buffers.

Pause transmission polling

When DMA detects all descriptors and the TXBU bit of ETH_DMASTS register is set, the transmission polling will be suspended. Or when a transmission error caused by underrun is detected, the frame transmission will be aborted. The corresponding transmit descriptor 0 bit will be set to 1. If the second condition occurs, AINTS bit and TXUNF bit of ETH_DMASTS register will be set, and if the information is written to the transmission descriptor 0, the transmission

polling will also be suspended.

27.3.4.7 Functional description of general transmit descriptor

The general transmit descriptor structure consists of four 32-bit words. If the timestamp is activated or IPv4 checksum offload is activated, the enhanced descriptor must be used.

Transmit descriptor word 0 (TXDES0)

Field	Name	R/W	Description
0	DEF	R/W	Deferred When this bit is set, it indicates that the MAC is delayed before transmission due to the existence of carrier. This bit is valid only in half-duplex mode. 0: No delay 1: Delay
1	UFERR	R/W	Underflow Error When this bit is set, it indicates the MAC terminates the frame because the data arrives late from the host memory. The underflow error indicates that the DMA encountered an empty transmit buffer while transmitting frames. The transmitting process enters the pending state.
2	EDEF	R/W	Excessive Deferral If MAC_CFG[4] is set to 1, this bit indicates that transmission has been over.
6:3	CCNT	R/W	Collision Count The value of this bit field indicates the number of collision that occurs before frame transmission. Invalid when TXDES0[8] is set to 1.
7	VLANF	R/W	VLAN Frame When this bit is set, it indicates that the transmitted frame is a frame of VLAN type.
8	EC	R/W	Excessive Collision When this bit is set, it indicates that the transmission is terminated after 16 consecutive collisions when trying to transmit the current frame. If MAC_CFG[9] is set, this bit will be set after the first collision, and the transmission of the frame will be terminated.
9	LC	R/W	Late Collision When this bit is set, it indicates that the frame transmission is terminated due to a collision after the collision window. This bit is invalid if underflow error is set.
10	NC	R/W	No Carrier When this bit is set, it indicates that the carrier detection signal of PHY is continuously formed during transmission.
11	LSC	R/W	Loss of Carrier When this bit is set, it indicates that the carrier is lost during frame transmission. Only when the MAC works in half-duplex mode, it is valid for frames transmitted without conflict.

Field	Name	R/W	Description
12	IPERR	R/W	<p>IP Payload Error</p> <p>When this bit is set to 1, it indicates that the MAC transmitter detects an error in the TCP, UDP, or ICMP IP packet payload. The transmitter will check the payload length received in the IPv4 or IPv6 header according to the actual number of bytes of TCP, UDP or ICMP IP packets received from the application program. If there is mismatch, the error status will be displayed.</p>
13	FF	R/W	<p>Frame Flushed</p> <p>When this bit is set, it indicates that DMA or MTL refreshes the frame due to the software refresh command given by the CPU.</p>
14	JTO	R/W	<p>Jabber Timeout</p> <p>When this bit is set, it indicates that the MAC transmitter has experienced a jabber timeout. This bit can be set only when JDIS bit of MAC_CFG register is not set.</p>
15	ERRS	R/W	<p>Error Summary</p> <p>The value is OR operation result of the following bits:</p> <p>TXDES0[1]: UFERR TXDES0[2]: EDEF TXDES0[8]: EC TXDES0[9]: LC TXDES0[10]: NC TXDES0[11]: LSC TXDES0[12]: IPERR TXDES0[13]: FF TXDES0[14]: JTO TXDES0[16]: IHERR</p>
16	IHERR	R/W	<p>IP Header Error</p> <p>When this bit is set to 1, it indicates that the MAC transmitter has detected an error in the IP data header. The transmitter will check the header length of IPv4 packets according to the number of header bytes received from the application program. If there is a mismatch, it indicates the error status. If the main header length of IPv6 frame is not 40 bytes, a header error will be reported. If the value of the header length field of IPv4 frame is less than 0x5, a header error will also be reported. Besides, the Ethernet length/type field value of IPv4 or IPv6 frame must match the IP header version received along with the data packet.</p>
17	TXTSS	R/W	<p>TX Timestamp Status</p> <p>This status bit indicates that the timestamp of the corresponding transmitted frame has been captured. When this bit is set, TXDES2 and TXDES3 have the timestamp values captured for the transmitted frames. This bit field is valid only when the last control bit (TXDES0[29]) in the descriptor is set.</p> <p>When the enhanced descriptor is enabled, TXTSS=1 indicates that there is timestamp value in TXDES6 and TXDES7.</p>
19:18	Reserved		

Field	Name	R/W	Description
20	TXCH	R/W	<p>Second Address Chained</p> <p>When this bit is set to 1, the second address in the descriptor is the address of the next descriptor, not the address of the second buffer, and TXDES1[28:16] is "irrelevant" value. The priority of TXDES0[21] is higher than TXDES0[20].</p>
21	TXENDR	R/W	<p>Transmit End of Ring</p> <p>When this bit is set to 1, the descriptor list has reached the last descriptor. DMA will return the base address of the descriptor list and form a descriptor ring.</p>
23:22	CHINS	R/W	<p>Checksum Insertion Control</p> <p>These bits control the calculation and insertion of checksum. The bit codes are as follows:</p> <p>00: Disable checksum insertion</p> <p>01: Enable calculation and insertion of IP header checksum</p> <p>10: Enable the calculation and insertion of payload checksum and IP header checksum, but the pseudo header checksum will not be calculated in hardware</p> <p>11: Enable the calculation and insertion of payload checksum and IP header checksum, and the pseudo header checksum will be calculated in hardware.</p>
24	Reserved		
25	TXTSEN	R/W	<p>Transmit Timestamp Enable</p> <p>When this bit is set to 1 and TSEN is set to 1, the IEEE1588 hardware timestamp function will be activated for the transmitted frame described in the descriptor. This bit is valid only when TXDES0[28]=1.</p>
26	DISP	R/W	<p>Disable Pad</p> <p>0: DMA will automatically add complementary bit item and CRC for frames less than 64 bytes. Whether to add CRC field has nothing to do with TXDES0[27]</p> <p>1: MAC will not automatically add complementary bit item for frames less than 64 bytes</p> <p>This bit is valid only when TXDES0[28]=1.</p>
27	DISC	R/W	<p>Disable CRC</p> <p>When this bit is set to 1, MAC will not attach the CRC to the end of the transmitted frame. This bit is valid only when TXDES0[28]=1.</p>
28	FS	R/W	<p>First Segment</p> <p>When this bit is set to 1, it indicates that the buffer includes the first segment of the frame.</p>
29	LS	R/W	<p>Last Segment</p> <p>When this bit is set to 1, it indicates that the buffer includes the last segment of the frame.</p>
30	INTC	R/W	<p>Interrupt on Completion</p> <p>When this bit is set to 1, after transmission of current frame is completed, an interrupt will be transmitted.</p>

Field	Name	R/W	Description
31	OWN	R/W	Own 0: This descriptor belongs to CPU 1: This descriptor belongs to DMA DMA will clear this bit when the frame transmission is completed or the buffer allocated in the descriptor is empty. All bits of the first descriptor of this frame should be set after all subsequent descriptors belonging to the same frame are set.

Transmit descriptor word 1 (TXDES1)

Field	Name	R/W	Description
12:0	TXBS1	R/W	Transmit Buffer 1 Size These bits indicate the size of the first data buffer. If the bit is 0, DMA will ignore this buffer and use the buffer 2 or the next descriptor, depending on the value of TXDES0[20].
15:13	Reserved		
28:16	TXBS2	R/W	Transmit Buffer 2 Size These bits indicate the size of the second data buffer in bytes. If TXDES0[20]=1, this field will be invalid.
31:29	Reserved		

Transmit descriptor word 2 (TXDES2)

Field	Name	R/W	Description
31:0	TXADDR1_TXFTSL	R/W	Transmit Buffer 1 Address Pointer / Transmit frame timestamp low It indicates the location of the data in the memory to the DMA. When all data have been transmitted, the DMA can use these bits to return the timestamp data. TXADDR1: When TXDES0[31]=1, these bits indicate the physical address of buffer 1. There are no restrictions on buffer address alignment. TXFTSL: Before TXDES0[31] is cleared to zero, the DMA will update this field with the 32 least significant bits of the timestamp captured for the corresponding transmitted frame. The bit field contains a timestamp only when the timestamp function of this frame is activated and LS=1.

Transmit descriptor word 3 (TXDES3)

Field	Name	R/W	Description
31:0	TXADDR2_TXFTSH	R/W	<p>Transmit Buffer 2 Address Pointer (Next descriptor address) / Transmit frame timestamp high</p> <p>It indicates the location of the data in the memory to the DMA. When all data have been transmitted, the DMA can use these bits to return the timestamp data.</p> <p>TXADDR2: When TXDES0[31]=1 and the descriptor ring structure is used, these bits indicate the physical address of buffer 2. If TXDES1[24]=1, this address contains the pointer of the physical register where the next descriptor is located. The buffer address pointer matches the bus width only when TXDES1[24]=1.</p> <p>TXFTSH: Before TXDES0[31] is cleared to zero, the DMA will update this field with the 32 most significant bits of the timestamp captured for the corresponding transmitted frame. The bit field contains a timestamp only when the timestamp function of this frame is activated and LS=1.</p>

27.3.4.8 Functional description of enhanced transmit descriptor

If the timestamp or IPv4 checksum offload is activated, the enhanced descriptor must be used. The enhanced descriptor consists of eight 32-bit words, which is twice the normal size of the descriptor. Definitions of TXDES0, TXDES1, TXDES2 and TXDES3 are the same as those of general transmit descriptor. TXDES6 and TXDES7 contain the timestamp.

When selecting the enhanced descriptor mode, 32-byte memory need to be allocated for each descriptor. If the timestamp or IPv4 checksum offload is not used, the enhanced descriptor format can be disabled, and the software can use a general descriptor with a default size of 16 bytes.

Transmit descriptor word 4 (TXDES4)

Field	Name	R/W	Description
31:0			Reserved

Transmit descriptor word 5 (TXDES5)

Field	Name	R/W	Description
31:0			Reserved

Transmit descriptor word 6 (TXDES6)

Field	Name	R/W	Description
31:0	TXFTSL	R/W	<p>Transmit Frame Timestamp Low</p> <p>This bit field will be updated by the DMA with the 32 least significant bits of the timestamp captured for the corresponding transmitted frame. The bit field contains a timestamp only when LS=1.</p>

Transmit descriptor word 7 (TXDES7)

Field	Name	R/W	Description
31:0	TXFTSH	R/W	Transmit Frame Timestamp High This bit field will be updated by the DMA with the 32 most significant bits of the timestamp captured for the corresponding transmitted frame. The bit field contains a timestamp only when LS=1.

27.3.4.9 Rx DMA

Obtain receiving descriptor

The receiver always tries to get an additional descriptor to add to the frame to be received. It will attempt to obtain the descriptor when any of the following operations occurs:

- (1) The command of receiving polling requirements has been issued
- (2) After DMA runs, the STRX bit of ETH_DMAOPMOD register is immediately set
- (3) The descriptor data buffer is full before the end of the currently transmitted frame
- (4) The receiving process is suspended because RDES0[OWN]=0, and a new frame is received
- (5) The receive data frame is completed, but the receive descriptor is not disabled

Process received frames

The MAC will transmit the received frames to the memory only when the frame whose size is not less than the threshold number of bytes set for the receive FIFO passes the address filtering, or when the whole frame is written to the FIFO in the storage and forwarding mode.

Stop when receiving

If a new received frame is detected when the receiving process is suspended, the DMA will obtain the current descriptor in memory again. If the descriptor is owned by DMA, the frame will be received again. If it is owned by the host, by default, the DMA will discard the current frame at the top of Rx FIFO and the lost frame counter will increase. If multiple frames are stored in Rx FIFO, the above process will be repeated. After DISFRXF bit of ETH_DMAOPMOD register is set, it can avoid discarding or refreshing the frame at the top of the Rx FIFO. At this time, RXBU bit is set to 1 and the receiving process returns to the suspended state.

27.3.4.10 Functional description of general receive descriptor

The general receive descriptor structure consists of four 32-bit words. If the timestamp function or IPv4 checksum offload is activated, the enhanced descriptor must be used.

Receive descriptor word 0 (RXDES0)

Field	Name	R/W	Description
0	PERR_ESA	R/W	<p>Payload Checksum Error / extended status available</p> <p>When this bit is set, the TCP, UDP or ICMP checksum calculated by the core does not match the checksum field of the received encapsulated TCP, UDP or ICMP segment. This bit will also be set when the number of payload bytes received does not match the value of the length field of the IPv4 or IPv6 datagram encapsulated in the received Ethernet frame.</p> <p>After the enhanced descriptor format is enabled, this bit has ESA functions. When ESA is set to 1, it indicates that there is an extended state in RXDES4. ESA is valid only when RXDES0[8]=1.</p>
1	CERR	R/W	<p>CRC Error</p> <p>When this bit is set, a CRC error will occur on the received frame. This bit is valid only when RXDES0[8]=1</p>
2	DERR	R/W	<p>Dribble Error</p> <p>When this bit is set, the received frame has a multiple of non-integer bytes. This bit is valid only in MII mode.</p>
3	RERR	R/W	<p>Receive Error</p> <p>When this bit is set and RX_DV signal is transmitted during frame receiving, RX_ERR signal will be generated.</p>
4	RXWDTTO	R/W	<p>Receive Watchdog Timeout</p> <p>When this bit is set, the receive watchdog timer has timed out when receiving the current frame, and the current frame will be truncated when the watchdog times out.</p>
5	FT	R/W	<p>Frame Type</p> <p>0: The received frame is an Ethernet type frame 1: The received frame is an IEEE802.3 frame</p> <p>When this bit is set. When this bit is reset, it indicates that this bit is invalid for short frames less than 14 bytes.</p>
6	LC	R/W	<p>Late Collision</p> <p>When this bit is set, a delay collision occurs when a frame is received in half-duplex mode.</p>
7	IPCERR_TSV	R/W	<p>IPv header Checksum Error / Time Stamp Valid</p> <p>When this bit is set, there is an error in the IPv4 or IPv6 header. The reasons may be: the Ethernet type field is inconsistent with the IP header version field, and does not match the checksum of the header in IPv4, or the Ethernet frame lacks the required number of IP header bytes.</p> <p>After the enhanced descriptor format is enabled, this bit has TSV functions. When TSV=1, it indicates that the timestamp snapshot will be written in RXDES6 and RXDES7. TSV is valid only when RXDES0[8]=1.</p>

Field	Name	R/W	Description
8	LDES	R/W	Last Descriptor When this bit is set, the buffer pointed to by the descriptor is the last buffer of the frame.
9	FDES	R/W	First Descriptor When this bit is set, the descriptor contains the first buffer of the frame. If the size of the first buffer is 0, the second buffer contains the beginning of the frame. If the size of the second buffer is also 0, the next descriptor contains the beginning of the frame.
10	VLANF	R/W	VLAN Frame When this bit is set, the frame referred to by this descriptor is a VLAN frame with MAC tag.
11	OFERR	R/W	Overflow Error When this bit is set, the received frame is damaged due to buffer overflow in Rx FIFO.
12	LERR	R/W	Length Error When this bit is set, the actual length of the received frame does not match the length/type field. This bit is valid only when RXDES0[5]=0.
13	SADDRF	R/W	Source Address Filter Fail When this bit is set, the SA field of the frame does not pass the SA filter in the MAC.
14	DESERR	R/W	Descriptor Error When this bit is set, it indicates that the frame is truncated because the frame is not suitable for the current descriptor buffer, and DMA has no next descriptor. The frame is truncated. Note: This field is valid only when the last descriptor (RXDES0[8]) is set.
15	ERRS	R/W	Error Summary The value is OR operation result of the following bits: RXDES0[0]: PERR_ESA RXDES0[1]: CERR RXDES0[3]: RERR RXDES0[4]: RXWDTTO RXDES0[6]: LC RXDES0[7]: IPCERR_TSV RXDES0[11]: OFERR RXDES0[14]: DESERR
29:16	FL	R/W	Frame Length This bit field indicates the byte length of the received frame transmitted to the host memory. This bit is valid only only when RXDES0[8]=1 and RXDES0[14]=0. When RXDES0[8]=0 and ERRS=0, it indicates the cumulative number of bytes that have been transmitted to the current frame.
30	ADDRF	R/W	Destination Address Filter Fail When this bit is set, it indicates the frame that fails DA filtering in MAC.

Field	Name	R/W	Description
31	OWN	R/W	Own 0: This describer belongs to CPU 1: This describer belongs to DMA This bit will be cleared when DMA completes frame receiving or the allocated buffer in the descriptor is full.

Table 145 Configuration in Normal Descriptor Format

Bit 0 (PERRC_ESA)	Bit 5 (FT)	Bit 7 (IPCERR_TSV)	Frame state
0	0	0	IEEE 802.3 type frame
1	0	1	Type frame which is neither IPv4 nor IPv6
0	1	0	IPv4/IPv6 type frame; checksum error is not detected
1	1	0	IPv4/IPv6 type frame; payload checksum error is detected
0	1	1	IPv4/IPv6 type frame; IP header checksum error is detected
1	1	1	IPv4/IPv6 type frame; IP header and payload checksum error are detected
1	0	0	IPv4/IPv6 type frame; there is no IP header checksum error, and the payload check bypasses because the payload is not supported
0	0	1	Reserved

Receive descriptor word 1 (RXDES1)

Field	Name	R/W	Description
12:0	RXBS1	R/W	Receive Buffer 1 Size 0: DMA will ignore this buffer and use the buffer 2 or the next descriptor according to the value of RXCH bit. Other: It indicates the size of the first data buffer. The buffer size must be a multiple of 4, 8, or 16, depending on the bus width, even if the value of the buffer 2 address pointer is not aligned. When the buffer size is not a multiple of 4, 8, or 16, the generated behavior is undefined.
13	Reserved		
14	RXCH	R/W	Second Address Chained When this bit is set, the second address in the descriptor is the address of the next descriptor, not the address of the second buffer. Ignore the value of RXBS2. RXER has priority over RXCH.
15	RXER	R/W	Receive End of Ring When this bit is set, it indicates that the descriptor list has reached the final descriptor. DMA will return the base address of the descriptor list and create a descriptor ring.

Field	Name	R/W	Description
28:16	RXBS2	R/W	<p>Receive Buffer 2 Size</p> <p>It indicates the size of the second data buffer. The buffer size must be a multiple of 4, 8, or 16, depending on the bus width, even if the value of the buffer 1 address pointer is not aligned. When the buffer size is not a multiple of 4, 8, or 16, the generated behavior is undefined.</p> <p>This bit field will be invalid if RXCH bit is set.</p>
30:29	Reserved		
31	DINTC	R/W	<p>Interrupt on Completion Disable</p> <p>When this bit is set, it will prevent the setting of RXFLG bit and make the received frame end in the buffer indicated by the descriptor, so as to disable causing the host interrupt.</p>

Receive descriptor word 2 (RXDES2)

Field	Name	R/W	Description
31:0	RXADDR1_RXFTSL	R/W	<p>Receive Buffer 1 Address Pointer / Receive Frame Timestamp Low</p> <p>It indicates the location of the data in the memory to the DMA. When all data have been transmitted, the DMA can use these bits to return the timestamp data.</p> <p>RXADDR1: When RXDES0[OWN]=1, these bits indicate physical address of the buffer 1. Except when the starting point of the frame is stored by using the value of RXDES2, the address is generated by DMA by using the configured value. During the start of transmitted frame, the DMA will perform write operation when RXDES2[3:0]=0, but the frame data will be shifted according to the actual buffer address pointer. When the address pointer points to the buffer where the middle or last part of the frame is stored, the DMA will ignore RXDES2[3:0]. There are no restrictions on buffer address alignment.</p> <p>RXFTSL: Before RXDES0[OWN] is cleared to zero, the DMA will update this field with the 32 least significant bits of the timestamp captured for the corresponding transmitted frame. The bit field contains a timestamp only when the timestamp function of this frame is activated and LS=1.</p>

Receive descriptor word 3 (RXDES3)

Field	Name	R/W	Description
31:0	RXADDR2_RXFTSH	R/W	<p>Receive Buffer 2 Address Pointer (Next Descriptor Address) / Receive Frame Timestamp High</p> <p>It indicates the location of the data in the memory to the DMA. When all data have been transmitted, the DMA can use these bits to return the timestamp data.</p> <p>RXADDR1: When RXDES0[OWN]=1 and the descriptor ring structure is used, these bits indicate the physical address of buffer 2. If RXDES[24]=1, this address contains the pointer of the physical register where the next descriptor is located. The buffer address pointer matches the bus width only when RXDES1[24]=1. When RXDES[24]=0, except when the starting point of the frame is stored by using the value of RXDES2, the address is generated by DMA by using the configured value. When the address pointer points to the buffer where the middle or last part of the frame is stored, the DMA will ignore RXDES2[3:0], and there are no restrictions on buffer address alignment.</p> <p>RXFTSH: Before RXDES0[OWN] is cleared to zero, the DMA will update this field with the 32 least significant bits of the timestamp captured for the corresponding transmitted frame. The bit field contains a timestamp only when the timestamp function of this frame is activated and LS=1.</p>

27.3.4.11 Functional description of enhanced receive descriptor

If the timestamp or IPv4 checksum offload is activated, the enhanced descriptor must be used. The enhanced descriptor consists of eight 32-bit words, which is twice the normal size of the descriptor. Definitions of RXDES0, RXDES1, RXDES2 and RXDES3 are the same as those of general receive descriptor. RXDES4 includes extended state, and RXDES6 and RXDES7 include timestamp.

When selecting the enhanced descriptor mode, 32-byte memory need to be allocated for each descriptor. If the timestamp or IPv4 checksum offload is not used, the enhanced descriptor format can be disabled, and the software can use a general descriptor with a default size of 16 bytes.

Receive descriptor word 4 (RXDES4)

It is valid only when there is a state related to IPv4 checksum or timestamp.

Field	Name	R/W	Description
2:0	IPPT	R/W	<p>IP payload type</p> <p>If IPv4 checksum offload is activated, it indicates the payload type encapsulated in IP datagram. These bits are "00" when there is an IP header error or there is a segmented IP.</p> <p>000: Unknown, or IP payload not processed 001: UDP 010: TCP 011: ICMP 1xx: Reserved</p>

Field	Name	R/W	Description
3	IPHERR	R/W	IP header error When this bit is set, the 16-bit IPv4 header checksum calculated by the core does not match the received checksum, or the IP datagram version does not match the Ethernet type value.
4	IPPERR	R/W	IP payload error When this bit is set, the 16-bit IP payload checksum calculated by the core does not match the received checksum. When the TCP, UDP or ICMP segment length does not match the payload length value in the IP header field, it will also be set to 1.
5	PCBP	R/W	IP checksum bypassed When this bit is set, the checksum offload engine will be bypassed.
6	IPV4P	R/W	receive IPv4 packet When this bit is set, an IPv4 packet is received.
7	IPV6P	R/W	receive IPv6 packet When this bit is set, an IPv6 packet is received.
11:8	PTPMT	R/W	PTP message type 0000: No PTP message received 0001: SYNC (all clock types) 0010: Follow_Up (all clock types) 0011: Delay_Req (all clock types) 0100: Delay_Resp (all clock types) 0101: Pdelay_Req (in point-to-point transparent clock) or Announce (in ordinary clock or boundary clock) 0110: Pdelay_Resp (in point-to-point transparent clock) or Management (in ordinary clock or boundary clock) 0111: Pdelay_Resp_Follow_Up (in point-to-point transparent clock) or Signaling (in ordinary clock or boundary clock) 1xxx: Reserved
12	PTPFT	R/W	PTP frame type 0: Transmit through UDP-IPv4 or UDP-IPv6 1: Transmit through Ethernet Valid only when the message type is non-zero. The type of packet received can be identified by bit 6 or bit 7.
13	PTPV	R/W	PTP version Version format used by the received PTP message 0: Version 1 1: Version 2 Valid only when the message type is non-zero.
31:14	Reserved		

Receive descriptor word 5 (RXDES5)

Field	Name	R/W	Description
31:0	Reserved		

Receive descriptor word 6 (RXDES6)

Field	Name	R/W	Description
31:0	RXFTSL	R/W	Receive Frame Timestamp Low This bit field will be updated by the DMA with the 32 least significant bits of the timestamp captured for the corresponding received frame. DMA updates the bit field only for the last descriptor of the received frame. When this bit field and RXFTSH are set at the same time, it is regarded that the timestamp has been damaged.

Receive descriptor word 7 (RXDES7)

Field	Name	R/W	Description
31:0	RXFTSH	R/W	Receive Frame Timestamp High This bit field will be updated by the DMA with the 32 most significant bits of the timestamp captured for the corresponding received frame. DMA updates the bit field only for the last descriptor of the received frame. When this bit field and RXFTSL are set at the same time, it is regarded that the timestamp has been damaged.

27.3.4.12 DMA interrupt

There are two groups of interrupts: normal interrupt and abnormal interrupt. The interrupt can be cleared by writing to the corresponding bit of ETH_DMASTS register. When all enabled interrupts in the group are cleared, the summary bit will also be cleared to zero. If the interrupt is caused by the MAC core, the PMTFLG or TSTFLG bits in the ETH_DMASTS register will be set to high level.

27.3.5 Ethernet interrupt

The Ethernet controller has two interrupt vectors: one for normal Ethernet operation and one for Ethernet wake-up events only when mapped to EINT 19. The first Ethernet vector is reserved for interrupts generated by MAC and DMA. The second is reserved for interrupts generated by PMT when a wake-up event occurs. The mapping of the wake-up event to EINT 19 makes the core exit the low-power mode and generate an interrupt.

When the Ethernet wake-up event mapped to EINT 19 occurs and both MAC PMT interrupt and EINT 19 interrupt with rising edge detection are enabled, two interrupts will be generated.

27.4 MAC register address mapping

Table 146 Register Address Mapping

Register name	Description	Offset address
MAC_CFG	Configuration register	0x00
MAC_FRAF	Frame filter register	0x04
MAC_HTH	Hash table high-bit register	0x08

Register name	Description	Offset address
MAC_HTL	Hash table low-bit register	0x0C
MAC_ADDR	MII address register	0x10
MAC_DATA	MII data register	0x14
MAC_FCTRL	Receive flow control register	0x18
MAC_VLANT	VLAN tag register	0x1C
MAC_REMVKUPFFL	Remote wake-up frame filter register	0x28
MAC_PMTCTRLSTS	PMT control and state register	0x2C
MAC_DBG	Debug register	0x34
MAC_ISTS	Interrupt state register	0x38
MAC_IMASK	Interrupt mask register	0x3C
MAC_ADDR0H	MAC address 0 high register	0x40
MAC_ADDR0L	MAC address 0 low register	0x44
MAC_ADDR1H	MAC address 1 high register	0x48
MAC_ADDR1L	MAC address 1 low register	0x4C
MAC_ADDR2H	MAC address 2 high register	0x50
MAC_ADDR2L	MAC address 2 low register	0x54
MAC_ADDR3H	MAC address 3 high register	0x58
MAC_ADDR3L	MAC address 3 low register	0x5C

27.5 MAC register functional description

27.5.1 Configuration register (MAC_CFG)

Offset address: 0x00

Reset value: 0x0000 8000

Field	Name	R/W	Description
1:0	Reserved		
2	RXEN	R/W	Receiver Enable The receiving state machine of MAC can receive frames from MII. After this bit is set, the receiving state machine of MAC will be turned off after the current frame is received, and will receive no frame from the MII.
3	TXEN	R/W	Transmitter Enable The transmitting state machine of MAC can transmit on MII. After this bit is set, the transmitting state machine of MAC will be turned off after the current frame is transmitted, and will transmit no frame.

Field	Name	R/W	Description
4	DC	R/W	<p>Deferral Check</p> <p>The deferral check function enables MAC. When the delay of the transmitting state machine exceeds the mode of 24288 bits multiplied by 10 or 100 Mbps, the MAC will identify the frame aborted state, and set the excessive delay error in the transmitted frame state.</p> <p>When the bit is reset, the bit will disable the deferral check function until the CRS signal becomes an invalid signal, and the MAC will be delayed. This bit is applicable only in half-duplex mode.</p>
6:5	BL	R/W	<p>Back off Limit</p> <p>This bit determines the random integer (r) of the time delay (4096-bit time for 1000Mbps and 512-bit time for 10/100Mbps) that the MAC waits before retransmission attempt when retrying after collision. This bit is applicable only in half-duplex mode.</p> <p>00: $k = \min(n, 10)$ 01: $k = \min(n, 8)$ 10: $k = \min(n, 4)$ 11: $k = \min(n, 1)$</p> <p>Wherein, n=the number of retransmission attempts. The value range of random integer r is $0 \leq r < 2k$</p>
7	ACS	R/W	<p>Automatic Pad or CRC Stripping</p> <p>Only when the bit length of MAC is less than 1536 bytes, will Pad or FCS be removed when the frame comes in. All received frames with bit length greater than or equal to 1536 bytes are passed to the application program without removing Pad or FCS. When this bit is reset, the MAC will transmit all incoming frames to the host without modification.</p>
8	Reserved		
9	DISR	R/W	<p>Disable Retry</p> <p>MAC will try to transmit once only. When a collision occurs to the MII interface, the MAC will ignore transmission of the current frame and report the abortion of a frame with a large collision error in the transmitted frame state. When this bit is reset, retry the MAC according to the setting of BL bit. This bit is applicable only in half-duplex mode.</p>
10	IPC	R/W	<p>IPv4 Checksum Offload</p> <p>The MAC calculates all 16-bit 1 complement sum of all received Ethernet frame payloads. It also checks whether the IPv4 header checksum of the received Ethernet frame is correct, and gives the state in the receiving state word. This function is disabled when this bit is reset.</p>
11	DM	R/W	<p>Duplex Mode</p> <p>MAC works in full-duplex mode and can transmit and receive at the same time.</p>
12	LBM	R/W	<p>Loopback Mode</p> <p>When this bit is set, the MAC will run in loopback mode on the MII. The MII receive clock input (RX_CLK) needs to work in loopback mode normally, because there is no loopback in the transmit clock.</p>

Field	Name	R/W	Description
13	DISRXO	R/W	Disable Receive Own When it is confirmed that phy_txen_o is in half-duplex mode, MAC will disable receiving frames. When this bit is reset, MAC will receive all packets transmitted by PHY. This bit is not applicable if the MAC is working in full-duplex mode.
14	SSEL	R/W	Speed select 0: 10Mbps 1: 100Mbps
15	Reserved		
16	DISCRS	R/W	Disable Carrier Sense During Transmission When it is set to high, the MAC transmitter will ignore the MII CRS signal during frame transmission in half-duplex mode. This request results in no error due to carrier loss or no carrier in such transmission process. When it is set to low, the MAC transmitter will generate a carrier sense error and can even abort the transmission.
19:17	IFG	R/W	Inter-Frame Gap These bits are used to control the minimum gap between frames during transmission. 000: 96-bit time 001: 88-bit time 010: 80-bit time ... 111: 40-bit time In half-duplex mode, the minimum IFG can only be configured as 64 bits (IFG=100), and lower value will not be considered.
21:20	Reserved		
22	JDIS	R/W	Jabber Disable The MAC disables the Jabber timer on transmitting end. MAC can transmit up to 16384 bytes frames. When this bit is reset, if the application program transmits more than 2048 bytes of data during transmission, the MAC will cut off the transmitter.
23	WDTDIS	R/W	Watchdog Disable The MAC disables the watchdog timer on the receiving end. The MAC can receive up to 16384 bytes of frames. When this bit is reset, the MAC does not allow the received frame to exceed 2048 bytes or the watchdog timeout register. After the watchdog limits the number of bytes, the MAC will disable receiving any bytes.
24	Reserved		
25	CST	R/W	CRC Stripping for Type Frames The last 4 bytes of all Ethernet type frames are removed and deleted before they are forwarded to the application program.
31:26	Reserved		

27.5.2 Frame filter register (MAC_FRAF)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	PR	R/W	Promiscuous Mode The address filtering module will pass all incoming frames, regardless of destination address or source address. The SA or DA state bits of the receiving state word are always cleared.
1	HUC	R/W	Hash Unicast The MAC filters the destination address of unicast frames according to the hash table. After reset, the MAC performs perfect destination address filtering on unicast frames, which compares the DA field with the value programmed in the DA register.
2	HMC	R/W	Hash Multicast The MAC filters the destination address of received multicast frames according to the hash table. After reset, the MAC performs perfect destination address filtering on multicast frames, which compares the DA field with the value programmed in the DA register.
3	DAIF	R/W	DA Inverse Filtering The address check block compares the DA addresses of unicast and multicast frames in inverse filtering method. After reset, normal frame filtering will be performed.
4	PM	R/W	Pass All Multicast All received frames whose destination address is multicast address (the first field of the destination address fields is 1) will be delivered. The filtering of multicast frames after reset depends on HMC bit.
5	DISBF	R/W	Disable Broadcast Frames The address filter will filter all incoming broadcast frames. After reset, the address filter will transmit all received broadcast frames.
7:6	PCTRLF	R/W	Pass Control Frames These bits control the forwarding of all control frames (including unicast and multicast pause frames). 00: MAC filters all control frames arriving at the application program. 01: Even if all control frames except pause frame do not pass the address filter, the MAC will also forward them to the application program. 10: Even if the control frames do not pass the address filter, the MAC will also forward them to the application program. 11: MAC forwards the control frames that pass the address filtering. Note: MAC is enabled to full-duplex mode when RXFCTRLLEN bit of MAC_FCTRL is set.
8	SAIF	R/W	SA Inverse Filtering The address check block compares the addresses of SA in inverse filtering method. SA frames that match the SA register will be marked as SA address filter failure. After reset, the SA frames that do not match the SA register will be marked as SA address filter failure.
9	SAFEN	R/W	Source Address Filter Enable The MAC compares the SA field of the received frame with the value programmed in the enabled SA register. If the comparison fails, the MAC will discard the frame. After reset, the MAC will forward the received frames to the application program of receiving state for updating SAFEN bit.
10	HPF	R/W	Hash or Perfect Filter

Field	Name	R/W	Description
			If it matches the perfect filter or Hash filter set for the HMC or HUC bit, it will configure the address filter to pass the frame. When this bit is low and the HUC or HMC bit is set, the frame will be passed only when the Hash filter matches.
30:11	Reserved		
31	RXA	R/W	Receive All The MAC receiving module will transmit all received frames, regardless of whether they pass the address filter. The result of SA or Da filtering is updated in the corresponding bit of the receiving state word. When this bit is reset, the receiving module will only pass these frames to the application program that passes the SA or DA address filter.

27.5.3 Hash table high-bit register (MAC_HTH)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	HTH	R/W	Hash Table High High 32 bits of Hash table.

27.5.4 Hash table low-bit register (MAC_HTL)

Offset address: 0x0C

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	HTL	R/W	Hash Table Low Low 32 bits of Hash table.

27.5.5 MII address register (MAC_ADDR)

Offset address: 0x10

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	MB	R/W	MII Busy Write to MAC_HT register and this bit will be valid. During PHY register access period, the software sets this bit to 1, indicating that read or write access is in progress. Therefore, MII data should remain valid in a PHY write operation until the MAC clears this bit. For read operation, MAC_HT is valid after this bit is cleared. Subsequent read and write operation can be performed only after the previous operation is completed.
1	MW	R/W	MII Write For PHY, this bit indicates that this is a write operation using the MII data register. If this bit is not set, it indicates that this is a read operation and the data will be put in the MII data register.

Field	Name	R/W	Description
4:2	CR	R/W	<p>Clock Range</p> <p>The selection of CR clock range determines the frequency of HCLK and is used to determine the frequency of MDC clock:</p> <p>Select HCLK MDC clock</p> <p>000: 60-100 MHz-HCLK/42</p> <p>001: 100-150 MHz-HCLK / 62</p> <p>010: 20-35 MHz-HCLK/16</p> <p>011: 35-60 MHz-HCLK/26</p> <p>100: 150-168 MHz-HCLK/102</p> <p>101, 110, 111: Reserved</p>
5	Reserved		
10:6	MR	R/W	<p>MII Register</p> <p>These bits select the required register in the selected PHY devices.</p>
15:11	PA	R/W	<p>Physical Layer Address</p> <p>It indicates which of the 32 possible PHY devices are being accessed.</p>
31:16	Reserved		

27.5.6 MII data register (MAC_DATA)

Offset address: 0x14

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	MD	R/W	<p>MII Data</p> <p>The 16-bit data value read from PHY after performing the management of read operation, or the 16-bit data value written to PHY before performing the management of write operation.</p>
31:16	Reserved		

27.5.7 Receive flow control register (MAC_FCTRL)

Offset address: 0x18

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	FCTRLB/BPA	R/W	<p>Flow Control Busy/Back Pressure Activate</p> <p>When a pause control frame is initiated in full-duplex mode, this bit should be read as 0 before it is written to the flow control register. Only when the application program sets this bit to 1, can a pause control frame be initialized. During the transmission of the control frame, this bit continues to be set to indicate that the frame transmission is in progress. After the transmission of the pause control frame is completed, the MAC will reset this bit to 0. It cannot be written to the flow control register before this bit is cleared.</p> <p>In half-duplex mode, if the TXFCTRLLEN bit is set, the back pressure function will be activated. When this bit is set (and TXFCTRLLEN is set), the back pressure will be declared by the MAC core. During back pressure period, when the MAC receives a new frame, the transmitter starts to transmit JAM mode, which causes collision. When MAC is configured as full-duplex mode, BPA will be automatically disabled.</p>

Field	Name	R/W	Description
1	TXFCTRLLEN	R/W	<p>Transmit Flow Control Enable</p> <p>In full-duplex mode, when this bit is set, MAC will enable the flow control operation to transmit the pause frame. When this bit is reset, the flow control operation of MAC will be disabled, and MAC will not transmit any pause frame.</p> <p>In half-duplex mode, when this bit is set, the MAC will enable back pressure operation.</p> <p>When this bit is reset, the back pressure characteristic will be disabled.</p>
2	RXFCTRLLEN	R/W	<p>Receive Flow Control Enable</p> <p>When this bit is set, the MAC will decode the received pause frame and disable its transmitter within the specified pause time.</p> <p>When this bit is reset, the decoding function of the pause frame will be disabled.</p>
3	UNPFDETE	R/W	<p>Unicast Pause Frame Detect</p> <p>When this bit is set, the MAC uses the unique multicast address to detect the pause frames, and also uses the specified unicast address in the MAC_ADDR0H and MAC_ADDR0L registers to detect the pause frame.</p> <p>When this bit is reset, the MAC only detects the pause frame of the unique multicast address specified in the 802.3x standard.</p>
5:4	PTSEL	R/W	<p>Pause Threshold Select</p> <p>Set the threshold of Pause timer for automatic retransmission of pause frames. The threshold should always be less than the pause time configured by bit [31:16]. For example, if PT = 100H (256 slot time) and PTSEL = 01, and the second PAUSE frame is initiated at 228 (256-28) slot time after the first PAUSE frame is transmitted, the second Pause frame will be automatically transmitted.</p> <p>Select the threshold</p> <p>00: Pause time - 4-slot time</p> <p>01: Pause time - 28-slot time</p> <p>10: Pause time - 144-slot time</p> <p>11: Pause time - 256-slot time</p> <p>The slot time is defined as the time that the MII interface takes to transmit 512 bits (64 bytes)</p>
6	Reserved		
7	ZQPDIS	R/W	<p>Zero-quanta Pause Disable</p> <p>When this bit is set, it is disabled to automatically generate zero-range pause control frame when the flow control signal of FIFO layer fails.</p> <p>When this bit is reset, normal operation of automatic zero-range pause control frame generation is enabled.</p>
15:8	Reserved		
31:16	PT	R/W	<p>Pause Time</p> <p>This bit saves the value used in the transmission of control frame. If this bit is configured to be double synchronized to the MII clock domain, continuous write operations should be performed on the register only after at least 4 clock cycles in the target clock domain.</p>

27.5.8 VLAN tag register (MAC_VLANT)

Offset address: 0x1C

Reset value: 0x0000 0000

This register contains the IEEE 802.1Q VLAN tag, used to identify the VLAN frame. The MAC compares No. 13 and No. 14 bytes of the received frame (length/type) with 0x8100, and compares the next 2 bytes with VLAN tag; if the match is successful, set the receive VLAN bit of the received frame state. The legal length of the frame increases from 1518 bytes to 1522 bytes.

Field	Name	R/W	Description
15:0	VLANTID	R/W	VLAN Tag Identifier It contains 802.1Q VLAN tag, which is used to identify VLAN frames and compare them with No. 15 byte and No. 16 byte of the received frame. Bit [15:13] is the user priority, bit [12] is the canonical format indicator, and bit [11:0] is the VLAN identifier of the VLAN tag. When the VLANTCOMP bit is set, only bit [11:0] is used for comparison. If VLANTID is all 0, the MAC does not check the VLAN tag comparison of No. 15 byte and No. 16 byte, and declares all frames with Type value of 0x8100 as VLAN frames.
16	VLANTCOMP	R/W	12-bit VLAN Tag Comparison When this bit is set, the VLAN identifier of bit 12 instead of the complete 16-bit VLAN tag will be used for comparison and filtering. The VLAN tag bit [11:0] is compared with the corresponding bit in the received VLAN tag frame. When this bit is reset, all 16 bits of No. 15 and No. 16 bytes of the received VLAN frame will be used for comparison.
31:17	Reserved		

27.5.9 Remote wake-up frame filter register (MAC_REMWKUPFFL)

Offset address: 0x28

Reset value: 0x0000 0000

The application program will write/read the remote wake-up frame filter register through this address. In fact, the wake-up frame filter register is eight (opaque) wake-up frame filter registers. Eight continuous write operations to this address of the offset (0x0028) will write/read all wake-up frame filter registers. This register contains the high 16 bits of the seventh MAC address.

Wake-up frame filter register x (MAC_WKUPFFLx) (x=0-3)

Field	Name	R/W	Description
31:0	FLXBMASK	R/W	Filter x Byte Mask This register defines which bytes of the frame are detected by the filter x to determine whether the frame is a wake-up frame. MSB[31] must be zero. Bit y[30:0] is byte mask. If the bit y (the number of bytes) of byte mask is set to 1, the filter x offset + y of the incoming frame will be processed by the CRC module; otherwise, the filter x offset + y will be ignored.

Wake-up frame filter register 4 (MAC_WKUPFFL4)

Field	Name	R/W	Description
3:0	FL0COM	R/W	<p>Filter 0 Command</p> <p>This 4-bit command controls filter x operation. Bit 3 specifies the address type and defines the destination address type of the mode. When this bit is set to 1, the mode is applicable only to multicast frames. When this bit is reset, the mode is applicable only to unicast frames. Bit 2 and Bit 1 are reserved bits. Bit 0 is the enable bit of filter X; if bit 0 is set to 1, filter x will be enabled.</p>
7:4	Reserved		
11:8	FL1COM	R/W	<p>Filter 1 Command</p> <p>This 4-bit command controls filter x operation. Bit 3 specifies the address type and defines the destination address type of the mode. When this bit is set to 1, the mode is applicable only to multicast frames. When this bit is reset, the mode is applicable only to unicast frames. Bit 2 and Bit 1 are reserved bits. Bit 0 is the enable bit of filter X; if bit 0 is set to 1, filter x will be enabled.</p>
15:12	Reserved		
19:16	FL2COM	R/W	<p>Filter 2 Command</p> <p>This 4-bit command controls filter x operation. Bit 3 specifies the address type and defines the destination address type of the mode. When this bit is set to 1, the mode is applicable only to multicast frames. When this bit is reset, the mode is applicable only to unicast frames. Bit 2 and Bit 1 are reserved bits. Bit 0 is the enable bit of filter X; if bit 0 is set to 1, filter x will be enabled.</p>
23:20	Reserved		
27:24	FL3COM	R/W	<p>Filter 3 Command</p> <p>This 4-bit command controls filter x operation. Bit 3 specifies the address type and defines the destination address type of the mode. When this bit is set to 1, the mode is applicable only to multicast frames. When this bit is reset, the mode is applicable only to unicast frames. Bit 2 and Bit 1 are reserved bits. Bit 0 is the enable bit of filter X; if bit 0 is set to 1, filter x will be enabled.</p>
31:28	Reserved		

Wake-up frame filter register 5 (MAC_WKUPFFL5)

Field	Name	R/W	Description
7:0	FL0OFF	R/W	<p>Filter 0 Offset</p> <p>This register defines the offset (within the frame range) of the frame to be detected by the filter x. This 8-bit mode offset is the offset of the first byte of the filter x to be detected. The minimum allowable value is 12, which indicates the 13th byte of the frame (the offset value 0 indicates the first byte of the frame).</p>
15:8	FL1OFF	R/W	<p>Filter 1 Offset</p> <p>This register defines the offset (within the frame range) of the frame to be detected by the filter x. This 8-bit mode offset is the offset of the first byte of the filter x to be detected. The minimum allowable value is 12, which indicates the 13th byte of the frame (the offset value 0 indicates the first byte of the frame).</p>

Field	Name	R/W	Description
23:16	FL2OFF	R/W	<p>Filter 2 Offset</p> <p>This register defines the offset (within the frame range) of the frame to be detected by the filter x. This 8-bit mode offset is the offset of the first byte of the filter x to be detected. The minimum allowable value is 12, which indicates the 13th byte of the frame (the offset value 0 indicates the first byte of the frame).</p>
31:24	FL3OFF	R/W	<p>Filter 3 Offset</p> <p>This register defines the offset (within the frame range) of the frame to be detected by the filter x. This 8-bit mode offset is the offset of the first byte of the filter x to be detected. The minimum allowable value is 12, which indicates the 13th byte of the frame (the offset value 0 indicates the first byte of the frame).</p>

Wake-up frame filter register 6 (MAC_WKUPFFL6)

Field	Name	R/W	Description
15:0	FL0CRC16	R/W	<p>Filter 0 CRC-16</p> <p>This register contains the CRC_16 value calculated according to the mode, and the byte mask programmed for wake-up filter register module.</p>
31:16	FL1CRC16	R/W	<p>Filter 1 CRC-16</p> <p>This register contains the CRC_16 value calculated according to the mode, and the byte mask programmed for wake-up filter register module.</p>

Wake-up frame filter register 7 (MAC_WKUPFFL7)

Field	Name	R/W	Description
15:0	FL2CRC16	R/W	<p>Filter 2 CRC-16</p> <p>This register contains the CRC_16 value calculated according to the mode, and the byte mask programmed for wake-up filter register module.</p>
31:16	FL3CRC16	R/W	<p>Filter 3 CRC-16</p> <p>This register contains the CRC_16 value calculated according to the mode, and the byte mask programmed for wake-up filter register module.</p>

27.5.10 PMT control and state register (MAC_PMTCTRLSTS)

Offset address: 0x2C

Reset value: 0x0000 0000

This register will configure the wake-up time request and monitor the wake-up event.

Field	Name	R/W	Description
0	PD	R/S	Power Down When this bit is set to 1, all received frames will be discarded. When receiving the magic packet or wake-up frame, this bit will be automatically cleared to zero and the power-down mode will be disabled. After this bit is cleared to zero, the received frame will be forwarded to the application program. This bit can be set to 1 only when the magic packet is enabled or the wake-up frame bit is set to 1.
1	MPEN	R/W	Magic Packet Enable When this bit is set to 1, this bit will enable the power management event generated due to receiving of a magic packet.
2	WKUPFEN	R/W	Wakeup Frame Enable When this bit is set to 1, this bit will enable the power management event generated due to receiving of a wake-up frame.
4:3	Reserved		
5	MPRX	RC_R	Magic Packet Received When this bit is set to 1, it indicates that the power management event is generated due to receiving of a magic packet. This bit can be cleared to zero by reading the register.
6	WKUPFRX	RC_R	Wakeup Frame Received When this bit is set to 1, it indicates that the power management event is generated due to receiving of a wake-up frame. This bit can be cleared to zero by reading the register.
8:7	Reserved		
9	GUN	R/W	Global Unicast When this bit is set to 1, it will enable any filtered unicast packet confirmed by MAC address to a wake-up frame.
30:10	Reserved		
31	WKUPFRST	R/S	Wakeup Frame Filter Register Pointer Reset When this bit is set to 1, it will reset the remote wake-up frame filter register pointer to 000b. It will be automatically cleared to zero after 1 clock cycle.

27.5.11 Debug register (MAC_DBG)

Offset address: 0x34

Reset value: 0x0000 0000

This register gives the status of all main modules of transmitting and receiving data path and FIFO. When it is set to all zero, it indicates that the MAC core is idle (FIFO is empty) and there is no activity in the data path.

Field	Name	R/W	Description
0	RPESTS	R	MAC MII Receive Protocol Engine Status When set to high, it indicates that the MAC MII receiving protocol engine is actively receiving data instead of in IDLE state.

Field	Name	R/W	Description
2:1	RFCFCSTS	R	MAC Receive Frame FIFO Controller Status When set to high, it indicates that the FIFO read/write controller of the MAC receive frame FIFO controller is active. 0: Write controller status 1: Read controller status
3	Reserved		
4	RWCSTS	R	RX FIFO Write Controller Active Status When set to high, it indicates that the RX FIFO write controller is valid and transmitting the received frame to FIFO.
6:5	RRCSTS	R	RX FIFO Read Controller State 00: IDLE state 01: Read frame data 10: Read frame status (or timestamp) 11: Refresh frame data and status
7	Reserved		
9:8	RXFSTS	R	RX FIFO full - level Status 00: RX FIFO is empty 01: RX FIFO fill level is below the flow control failure threshold 10: RX FIFO fill level is above the flow control activation threshold 11: RX FIFO is full
15:10	Reserved		
16	TPESTS	R	MAC MII Transmit Protocol Engine Status When set to high, it indicates that the MAC MII transmitting protocol engine is actively transmitting data instead of in idle state.
18:17	TFCSTS	R	MAC Transmit Frame Controller Status 00: IDLE state 01: Wait for the previous frame or IFG or return to the state of end of rollback cycle 10: Generate and transmit the pause frame (in full-duplex mode) 11: Transmit input frame
19	TXPAUSED	R	MAC Transmitter in Pause When set to high, it indicates that the MAC transmitter is in a pause state (in full-duplex mode), so no frames will be transmitted.
21:20	TRCSTS	R	TX FIFO Read Controller Status 00: IDLE state 01: Read status (transmit data to MAC transmitter) 10: Wait for TX status from MAC transmitter 11: Write the received TX status or refresh TX FIFO
22	TWCSTS	R	TX FIFO Write Controller Status When set to high, it indicates that TX FIFO write controller is active and transmitting data to TX FIFO.
23	Reserved		
24	TXFSTS	R	TX FIFO Not Empty Status When set to high, it indicates that TX FIFO is not empty and there are still some data waiting to be transmitted.

Field	Name	R/W	Description
25	TXSTSFSTS	R	TX Status FIFO Full Status When set to high, it indicates that TX FIFO is full. Therefore, no more frames can be received for transmission.
31:26	Reserved		

27.5.12 Interrupt state register (MAC_ISTS)

Offset address: 0x38

Reset value: 0x0000 0000

Field	Name	R/W	Description
2:0	Reserved		
3	PMTIS	R	PMT Interrupt Status This bit is set when a magic packet or remote wake-up frame is received in power-off mode. When bit [6:5] is cleared due to read operation of PMT control and state register, this bit will be cleared.
4	MMCIS	R	MMC Interrupt Status When any bit [6:5] is set to high, this bit will be set to high and it can be cleared only when all these bits are low.
5	MMCRXIS	R	MMC Receive Interrupt Status When an interrupt is generated in the MMC receive interrupt register, this bit will be set to high. When all bits in the interrupt register are cleared, this bit will also be cleared.
6	MMCTXIS	R	MMC Transmit Interrupt Status When an interrupt is generated in the MMC transmit interrupt register, this bit will be set to high. When all bits in the interrupt register are cleared, this bit will also be cleared.
8:7	Reserved		
9	TSIS	R	Timestamp Interrupt Status When the system time value is equal to or exceeds the value specified in the target time register, this bit will be set to 1. It will be cleared to zero when reading this register.
15:10	Reserved		

27.5.13 Interrupt mask register (MAC_IMASK)

Offset address: 0x3C

Reset value: 0x0000 0000

Field	Name	R/W	Description
2:0	Reserved		
3	PMTIM	R/W	PMT Interrupt Mask When this bit is set, the PMT interrupt status bit is set in the register "interrupt state register", so this bit disables generation of interrupt signal.
8:4	Reserved		

Field	Name	R/W	Description
9	TSTIM	R/W	Time Stamp Trigger Interrupt Mask If this bit is set to 1, generation of timestamp interrupts will be disabled.
15:10	Reserved		

27.5.14 MAC address 0 high register (MAC_ADDR0H)

Offset address: 0x40

Reset value: 0x0010 FFFF

Field	Name	R/W	Description
15:0	ADDR0H	R/W	MAC address 0 high bit [47:32] It contains the first 16 bits (47:32) of the first 6 bytes of MAC address 0. The MAC uses this field to filter the received frames and inserts the MAC address in the transmission flow control (pause) frame.
30:16	Reserved		
31	AL1	R	Always 1

27.5.15 MAC address 0 low register (MAC_ADDR0L)

Offset address: 0x44

Reset value: 0xFFFF FFFF

Field	Name	R/W	Description
31:0	ADDR0L	R/W	MAC Address 0 low bit [31:0] (MAC Address 1) This bit field contains the low 32 bits of the first 6-byte MAC address 0. This is the frame used by MAC to filter the received frames and insert the MAC address in the transmission flow control (pause) frame.

27.5.16 MAC address 1 high register (MAC_ADDR1H)

Offset address: 0x48

Reset value: 0x0000 FFFF

Field	Name	R/W	Description
15:0	ADDR1H	R/W	MAC address 1 high bit [47:32] It contains the first 16 bits (47:32) of the first 6-byte MAC address 1. The MAC uses this field to filter the received frames and inserts the MAC address in the transmission flow control (pause) frame.
23:16	Reserved		
29:24	MASKBCTRL	R/W	Mask Byte Control These bits are used to compare the mask control bits of 1 byte of each MAC address. When they are set to high level, the MAC core will not compare the corresponding bytes of the received DA/SA with the contents of the MAC address 1 register. Each bit is used to control the mask of bytes, as follows: Bit 29: ADDR1H [15:8] Bit 28: ADDR1H [7:0] Bit 27: ADDR1L [31:24] ...

Field	Name	R/W	Description
			Bit 24: ADDR1L [7:0]
30	ADDRSEL	R/W	Address Select 0: Compare the MAC address 1 [47:0] with the DA field of the received frame 1: Compare the MAC address 1 [47:0] with the SA field of the received frame
31	ADDREN	R/W	Address Enable 0: The address filter will ignore the address used for filtering 1: The address filter uses the MAC address 1 for filtering

27.5.17 MAC address 1 low register (MAC_ADDR1L)

Offset address: 0x4C

Reset value: 0xFFFF FFFF

Field	Name	R/W	Description
31:0	ADDR1L	R/W	MAC Address 1 low bit [31:0] This bit field contains the low 32 bits of the first 6-byte MAC address 1. If the application does not load the content of this bit field after initialization, the content will not be defined.

27.5.18 MAC address 2 high register (MAC_ADDR2H)

Offset address: 0x50

Reset value: 0x0000 FFFF

Field	Name	R/W	Description
15:0	ADDR2H	R/W	MAC address 2 high bit [47:32] (MAC Address 2) It contains the first 16 bits (47:32) of the first 6 bytes of MAC address 2.
23:16	Reserved		
29:24	MASKBCTRL	R/W	Mask Byte Control These bits are used to compare the mask control bits of 2 bytes of each MAC address. When they are set to high level, the MAC core will not compare the corresponding bytes of the received DA/SA with the contents of the MAC address 2 register. Each bit is used to control the mask of bytes, as follows: Bit 29: ADDR2H [15:8] Bit 28: ADDR2H [7:0] Bit 27: ADDR2L [31:24] ... Bit 24: ADDR2L [7:0]
30	ADDRSEL	R/W	Address Select 0: Compare the MAC address 2 [47:0] with the DA field of the received frame 1: Compare the MAC address 2 [47:0] with the SA field of the received frame
31	ADDREN	R/W	Address Enable 0: The address filter will ignore the address used for filtering 1: The address filter uses the MAC address 2 for filtering

27.5.19 MAC address 2 low register (MAC_ADDR2L)

Offset address: 0x54

Reset value: 0xFFFF FFFF

Field	Name	R/W	Description
31:0	ADDR2L	R/W	MAC Address 2 low bit [31:0] (MAC Address 2) This bit field contains the low 32 bits of the first 6-byte MAC address 2. If the application does not load the content of this bit field after initialization, the content will not be defined.

27.5.20 MAC address 3 high register (MAC_ADDR3H)

Offset address: 0x58

Reset value: 0x0000 FFFF

Field	Name	R/W	Description
15:0	ADDR3H	R/W	MAC address 3 high bit [47:32] (MAC Address 3) It contains the first 16 bits (47:32) of the first 6-byte MAC address 3.
23:16	Reserved		
29:24	MASKBCTRL	R/W	Mask Byte Control These bits are used to compare the mask control bits of 3 bytes of each MAC address. When they are set to high level, the MAC core will not compare the corresponding bytes of the received DA/SA with the contents of the MAC address 3 register. Each bit is used to control the mask of bytes, as follows: Bit 29: ADDR3H [15:8] Bit 28: ADDR3H [7:0] Bit 27: ADDR3L [31:24] ... Bit 24: ADDR3L [7:0]
30	ADDRSEL	R/W	Address Select 0: Compare the MAC address 3 [47:0] with the DA field of the received frame 1: Compare the MAC address 3 [47:0] with the SA field of the received frame
31	ADDREN	R/W	Address Enable 0: The address filter will ignore the address used for filtering 1: The address filter uses the MAC address 3 for filtering

27.5.21 MAC address 3 low register (MAC_ADDR3L)

Offset address: 0x5C

Reset value: 0xFFFF FFFF

Field	Name	R/W	Description
31:0	ADDR3L	R/W	MAC Address 3 low bit [31:0] (MAC Address 3) This bit field contains the low 32 bits of the first 6-byte MAC address 3. If the application does not load the content of this bit field after initialization, the content will not be defined.

27.6 MMC register address mapping

Table 147 MMC Register Address Mapping

Register name	Description	Offset address
MMC_CTRL	Control register	0x100
MMC_RXINT	Receive interrupt register	0x104
MMC_TXINT	Transmit interrupt register	0x108
MMC_RXINTMASK	Mask receive interrupt register	0x10C
MMC_TXINTMASK	Mask transmit interrupt register	0x110
MMC_TXGFSCCNT	Transmitted good frames single collision counter register	0x14C
MMC_TXGFMCCNT	Transmitted good frames more collision counter register	0x150
MMC_TXGFCNT	Transmitted good frames counter register	0x168
MMC_RXFCECNT	Received Frames CRC Error Counter register	0x194
MMC_RXFAECNT	Received frame alignment error counter register	0x198
MMC_RXGUNCNT	Received good unicast frame counter register	0x1C4

27.7 MMC register functional description

27.7.1 Control register (MMC_CTRL)

Offset address: 0x100

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	CNTRST	R/W	Counter Reset When this bit is set, all counters will be reset. This bit will be automatically cleared to zero after 1 clock cycle
1	CNTSTOPRO	R/W	Counter Stop Rollover When this bit is set, the counter will not return to zero when it reaches its maximum value.
2	RSTOR	R/W	Reset on read When this bit is set, after reading the MMC counter, this counter will be reset. The counter will be cleared to zero after reading the least significant byte channel.
3	MCNTF	R/W	MMC Counter Freeze When this bit is set, all MMC counters will be frozen so that they remain at the current value. (Only after this bit is cleared to zero, will the MMC counter be updated due to the existence of transmitted or received frames)

Field	Name	R/W	Description
4	MCNTP	R/W	MMC Counter Preset When this bit is set, all counters will be initialized or preset to almost full value or almost half value according to the above bit 5. This bit will be automatically cleared to zero after 1 clock cycle. This bit, together with bit 5, is used to debug and test the generation of interrupt which is caused because the MMC counter changes to half the full value or full value.
5	MCNTVALP	R/W	MMC Counter Value Preset When MCNTP bit is set to 1: When MCNTVALP is low, all MMC counters will be preset to almost half the value. All frame counters are preset to 0x7FFF_FFF0 (half value -16). When MCNTVALP is high, all MMC counters will be preset to almost full value. All frame counters are preset to 0xFFFF_FFF0 (full value -16).
31:6	Reserved		

27.7.2 Receive interrupt register (MMC_RXINT)

Offset address: 0x104

Reset value: 0x0000 0000

Field	Name	R/W	Description
4:0	Reserved		
5	RXFCE	RC_R	Received Frames CRC Error This bit will be set when the received frame counter has a CRC error and reaches half of its maximum value.
6	RXFAE	RC_R	Received Frames Alignment Error This bit will be set when the received frame counter has an alignment error and reaches half of its maximum value.
16:7	Reserved		
17	RXGUNF	RC_R	Received Good Unicast Frames This bit will be set when the received good unicast frame counter reaches half of its maximum value.
31:18	Reserved		

27.7.3 Transmit interrupt register (MMC_TXINT)

Offset address: 0x108

Reset value: 0x0000 0000

Field	Name	R/W	Description
13:0	Reserved		
14	TXGFSCOL	RC_R	Transmitted Good Frames Single Collision This bit will be set when the good frame counter transmitted after a single collision reaches half of its maximum value.
15	TXGFMCOL	RC_R	Transmitted Good Frames More Single Collision This bit will be set when the good frame counter transmitted after multiple collisions reach half of its maximum value.

Field	Name	R/W	Description
20:16	Reserved		
21	TXGF	RC_R	Transmitted Good Frames This bit will be set when the transmitted good frame counter reaches half of its maximum value.
31:22	Reserved		

27.7.4 Mask receive interrupt register (MMC_RXINTMASK)

Offset address: 0x10C

Reset value: 0x0000 0000

Field	Name	R/W	Description
4:0	Reserved		
5	RXFCEM	R/W	Received Frames CRC Error Mask When this bit is set, the interrupt will be masked when the received frame counter has a CRC error and reaches half of its maximum value.
6	RXFAEM	R/W	Received Frames Alignment Error Mask When this bit is set, the interrupt will be masked when the received frame counter has an alignment error and reaches half of its maximum value.
16:7	Reserved		
17	RXGUNFM	R/W	Received Good Unicast Frames Mask When this bit is set, the interrupt will be masked when the received good unicast frame counter reaches half of its maximum value.
31:18	Reserved		

27.7.5 Mask transmit interrupt register (MMC_TXINTMASK)

Offset address: 0x110

Reset value: 0x0000 0000

Field	Name	R/W	Description
13:0	Reserved		
14	TXGFSCOLM	R/W	Transmitted Good Frames Single Collision Mask When this bit is set, the interrupt will be masked when the good frame counter transmitted after single collision reaches half of its maximum value.
15	TXGFMCOLM	R/W	Transmitted Good Frames More Single Collision Mask When this bit is set, the interrupt will be masked when the good frame counter transmitted after multiple collisions reaches half of its maximum value.
20:16	Reserved		
21	TXGFM	R/W	Transmitted Good Frames Mask When this bit is set, the interrupt will be masked when the transmitted good frame counter reaches half of its maximum value.
31:22	Reserved		

27.7.6 Transmitted good frames single collision counter register (MMC_TXGFSCCNT)

Offset address: 0x14C

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TXGFSCCNT	R	Transmitted Good Frames Single Collision Counter Transmitted good frames single collision counter.

27.7.7 Transmitted good frames more collision counter register (MMC_TXGFMCCNT)

Offset address: 0x150

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TXGFMCCNT	R	Transmitted Good Frames More Collision Counter Transmitted good frames more collision counter register.

27.7.8 Transmitted good frames counter register (MMC_TXGFCNT)

Offset address: 0x168

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TXGFCNT	R	Transmitted Good Frames Counter Transmitted good frames counter.

27.7.9 Received Frames CRC Error Counter register (MMC_RXFCECNT)

Offset address: 0x194

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	RXFCECNT	R	Received Frames CRC Error Counter Received Frames CRC Error Counter.

27.7.10 Received frame alignment error counter register (MMC_RXFAECNT)

Offset address: 0x198

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	RXFAECNT	R	Received Frames Alignment Error Counter Received Frames Alignment Error Counter.

27.7.11 Received good unicast frame counter register (MMC_RXGUNCNT)

Offset address: 0x1C4

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	RXGUNCNT	R	Received Good Unicast Frames Counter Received Good Unicast Frames Counter.

27.8 PTP register address mapping

Used to support the register of precision network clock synchronization which is in accordance with IEEE 1588 standard.

Table 148 PTP Register Address Mapping

Register name	Description	Offset address
PTP_TSCTRL	Timestamp control register	0x700
PTP_SUBSECI	Subsecond increment register	0x704
PTP_TSH	Timestamp high bit register	0x708
PTP_TSL	Timestamp low bit register	0x70C
PTP_TSHUD	Timestamp high bit update register	0x710
PTP_TSLUD	Timestamp low bit update register	0x714
PTP_TSA	Timestamp addend register	0x718
PTP_TTSH	Target timestamp high bit register	0x71C
PTP_TTSL	Target timestamp low bit register	0x720
PTP_TSSTS	Timestamp state register	0x728
PTP_PPSCTRL	PPS control register	0x72C

27.9 PTP register functional description

27.9.1 Timestamp control register (PTP_TSCTRL)

Offset address: 0x700

Reset value: 0x0000 2000

Field	Name	R/W	Description
0	TSEN	R/W	Time Stamp Enable 0: Disable 1: Enable Since the maintained system time is suspended, after this bit is set to high level, it will be always necessary to initialize the timestamp function (system time).
1	TSUDSEL	R/W	Time Stamp Update Mode Select Select the method of updating the system timestamp 0: Rough update 1: Precision update
2	TSSTINIT	R/W	Time Stamp System Time Initialize When this bit is set, the system time will be initialized with the value specified in the timestamp high-bit update register and timestamp low-bit update register. Before this bit is set, it must be read as zero. After initialization, this bit will be cleared to zero.

Field	Name	R/W	Description
3	TSSTUD	R/W	Time Stamp System Time Update When this bit is set, the system time will be updated with the value specified in the timestamp high-bit update register and timestamp low-bit update register. TSSTINIT and TSSTUD must be read as zero before this bit is set. After the update is completed, this bit will be cleared to zero.
4	TSTRGIEN	R/W	Time Stamp Trigger Interrupt Enable When this bit is set, if the value written in the target time register is less than the system time, a timestamp interrupt will be generated. This bit will be cleared to zero when a timestamp interrupt is triggered.
5	TSADDUD	R/W	Time Stamp Addend Register Update When this bit is set, the contents of the timestamp addend register will be updated to PTP for precision calibration. After the update is completed, this bit will be cleared to zero. Before this bit is set, it must be read as zero.
7:6	Reserved		
8	TSSNEN	R/W	Time Stamp Snapshot for Received Frames Enable When this bit is set, all frames received by the core will enable timestamp snapshot.
9	TSSUBRO	R/W	Time Stamp Subsecond Rollover 0: The rollover value of the subsecond register reaches 0x7FFF FFFF. The subsecond increment is programmed according to the PTP reference clock frequency and the value of this bit. 1: If the subsecond counter value reaches 0x3B9A C9FF (decimal 999 999 999) and the number of timestamp (high-bit) seconds increases, the timestamp low-bit register will flip.
10	LISTVSEL	R/W	Listening Version Select Select the version format of listening PTP packet 0: Version 1 1: Version 2
11	TSSPTPEN	R/W	Time Stamp Snapshot for PTP Ethernet Frames Enable When this bit is set, the timestamp snapshot of the frame containing PTP message in the Ethernet frame will be taken. By default, take the snapshot of UDP IP Ethernet PTP packets.
12	TSS6EN	R/W	Time stamp snapshot for IPv6 frames Enable When this bit is set, the timestamp snapshot of IPv6 frames will be taken.
13	TSS4EN	R/W	Time Stamp Snapshot for IPv4 Frames Enable When this bit is set, the timestamp snapshot of IPv4 frames will be taken.
14	TSSMESEL	R/W	Time Stamp Snapshot for Message Select 0: Take snapshots of all messages except Announce, Management and Signaling 1: Take a timestamp snapshot of the event message (SYNC, Delay_Re, Pdelay_Req or Pdelay_Resp)

Field	Name	R/W	Description
15	TSSMNSEL	R/W	Time Stamp Snapshot for Master Node Select 0: Slave node 1: Master node
17:16	TSCLKNSEL	R/W	Time stamp Clock Node Select 00: Ordinary clock 01: Boundary clock 10: End-to-end transparent clock 11: Point-to-point transparent clock
18	TSSPTPFMACEN	R/W	Time Stamp PTP Frame Filtering MAC Address Enable When this bit is set and PTP is transmitted directly through Ethernet, this bit will filter PTP frames by using MAC address.
31:19	Reserved		

Table 149 Timestamp Snapshot Message

TSCLKNSEL	TSSMNSEL	TSSMESEL	Snapshot message
0X	Irrelevant	0	SYNC, Follow_Up, Delay_Req, Delay_Resp
	1	1	Delay_Req
	0	1	SYNC
10	x	0	SYNC, Follow_Up, Delay_Req, Delay_Resp
		1	SYNC, Follow_Up
11		0	SYNC, Follow_Up, Delay_Req, Delay_Resp, Pdelay_Req, Pdelay_Resp
		1	SYNC, Pdelay_Req, Pdelay_Resp

Note: x=not applicable

27.9.2 Subsecond increment register (PTP_SUBSECI)

Offset address: 0x704

Reset value: 0x0000 0000

Field	Name	R/W	Description
7:0	STSUBSECI	R/W	System Time Subseconds Increment It will be added to the system time subsecond value at the time of each update.
31:8	Reserved		

27.9.3 Timestamp high bit register (PTP_TSH)

Offset address: 0x708

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	STSEC	R	System Time Second Value System second time.

27.9.4 Timestamp low bit register (PTP_TSL)

Offset address: 0x70C

Reset value: 0x0000 0000

Field	Name	R/W	Description
30:0	STSUBSEC	R	System Time Subseconds Value System subsecond time, with precision of 0.46ns.
31	STSEL	R	System Time Select This bit indicates positive and negative values of the system time. 0: Positive 1: Negative Since the system time should always be positive, this bit is generally zero.

27.9.5 Timestamp high bit update register (PTP_TSHUD)

Offset address: 0x710

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TSUDSEC	R/W	Time Stamp Update Second Value The second time to be initialized or added to the system time.

27.9.6 Timestamp low bit update register (PTP_TSLUD)

Offset address: 0x714

Reset value: 0x0000 0000

Field	Name	R/W	Description
30:0	TSUDSUBSEC	R/W	Time Stamp Update Subseconds Value The subsecond time to be initialized or added to the system time. The precision is 0.46ns.
31	TSUDSEL	R/W	Time Stamp Update Select This bit indicates positive and negative values of the system time. 0: Positive 1: Negative When TSSTINIT bit is set, this bit is 0. When TSSTUD bit and this bit are set to 1 at the same time, the value of the timestamp update register shall be subtracted from the system time. Otherwise, it will be added to the system time.

27.9.7 Timestamp addend register (PTP_TSA)

Offset address: 0x718

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TSA	R/W	Time Stamp Addend Value The 32-bit time value to be added to the accumulator register, used for time synchronization.

27.9.8 Target timestamp high bit register (PTP_TTSH)

Offset address: 0x71C

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TTSH	R/W	Target Time Stamp High Value Storage second time. When the value of the timestamp matches or exceeds two target timestamp registers at the same time, the MAC will generate an interrupt.

27.9.9 Target timestamp low bit register (PTP_TTSL)

Offset address: 0x720

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TTSL	R/W	Target Time Stamp Low Value Storage nanosecond time. When the value of the timestamp matches or exceeds two target timestamp registers at the same time, the MAC will generate an interrupt.

27.9.10 Timestamp state register (PTP_TSSTS)

Offset address: 0x728

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TSSECOVR	R	Time Stamp Second Value Overflow When this bit is set, the second value of the timestamp has overflowed, exceeding 0xFFFF FFFF.
1	TTSRD	R	Target Time Stamp Value Reached When this bit is set, the system time value is greater than or equal to the value of PTP_TTS register.
31:2	Reserved		

27.9.11 PPS control register (PTP_PPSCCTRL)

Offset address: 0x72C

Reset value: 0x0000 0000

Field	Name	R/W	Description
3:0	PPSFSEL	R	PPS Frequency Selection PPS output frequency is set to 2^{PPSFSEL} Hz 0000: 1Hz; the binary flip pulse width is 125ms, and the digital flip pulse width is 100ms 0001: 2Hz, binary flip; the duty cycle is 50% (digital flip is not recommended) 0010: 4Hz, binary flip; the duty cycle is 50% (digital flip is not recommended) 0011: 8Hz, binary flip; the duty cycle is 50% (digital flip is not recommended) 0100: 16Hz, binary flip; the duty cycle is 50% (digital flip is not recommended) ... 1111: 32768Hz, binary flip; the duty cycle is 50% (digital flip is not recommended)

Field	Name	R/W	Description
			Note: As PPS output has irregular waveform at higher frequency, do not use the PPS output with frequency other than 1Hz as much as possible when using digital flip.
31:4	Reserved		

27.10 DMA register address mapping

Table 150 DMA Register Address Mapping

Register name	Description	Offset address
ETH_DMABMOD	DMA mode register	0x1000
ETH_DMATXPD	Transmit poll demand register	0x1004
ETH_DMARXPD	Receive poll demand register	0x1008
ETH_DMARXDLADDR	Receive descriptor list address register	0x100C
ETH_DMATXDLADDR	Transmit descriptor list address register	0x1010
ETH_DMASTS	State register	0x1014
ETH_DMAOPMOD	Operation mode register	0x1018
ETH_DMAINTEN	Interrupt enable register	0x101C
ETH_DMAMFABOCNT	Missed frame and buffer overflow counter register	0x1020
ETH_DMARXFLGWDT	Receive interrupt watchdog timer register	0x1024
ETH_DMAHTXD	Current host transmit descriptor register	0x1048
ETH_DMAHRXD	Current host receive descriptor register	0x104C
ETH_DMAHTXBADDR	Current host transmit buffer address register	0x1050
ETH_DMAHRXBADDR	Current host receive buffer address register	0x1054

27.11 DMA register functional description

27.11.1 DMA bus mode register (ETH_DMABMOD)

Offset address: 0x1000

Reset value: 0x0000 2101

Field	Name	R/W	Description
0	SWR	R/W	Software Reset When this bit is set, the MAC DMA controller will reset the MAC logic and all internal registers. It will be cleared automatically after all clock domains are reset. You should read a 0 value in this bit before reprogramming any registers.
1	DAS	R/W	DMA Arbitration Scheme It specifies the arbitration scheme between the transmitting and receiving paths of channel 0. 0: Weighted round robin scheduling of Rx:Tx is used, given in [15:14]

Field	Name	R/W	Description
			1: The priority of Rx is higher than that of Tx
6:2	DSL	R/W	<p>Descriptor Skip Length</p> <p>This bit specifies the number of Word, Dword, or Lword skipped between two unlinked descriptors Address skip starts from the end of the current descriptor to the beginning of the next descriptor. When the DSL value is equal to 0, DMA will regard the descriptor table as continuous in ring mode.</p>
7	EDFEN	R/W	<p>Enhanced Descriptor Format Enable</p> <p>When this bit is set, enable the enhanced descriptor format and increase the descriptor size to 32 bytes. If the timestamp function or IPv4 checksum offload has been activated, this bit must be set to 1.</p>
13:8	PBL	R/W	<p>Programmable Burst Length</p> <p>These bits indicate the maximum number of beats to be transmitted in a DMA transaction. This is the maximum value used in a single block read and write. Each time the burst transmission is started on the host bus, DMA will always attempt to follow the burst specified in PBL. PBL can be programmed with allowable value 1, 2, 4, 8, 16 and 32. Any other value may result in undefined behaviors. When USP is set to high level, the PBL value is only applicable to Tx DMA transactions.</p> <p>The PBL value has the following limitations: the maximum number of possible beats is limited by the size of Tx FIFO and Rx FIFO of MTL layer and the width of data bus on DMA. FIFO has a limitation, namely, the maximum beat supported is half the FIFO depth unless specified.</p>
15:14	PR	R/W	<p>Priority Ratio</p> <p>These bits control the priority ratio of weighted round robin arbitration between Rx direct memory access and Tx direct memory access. These bits are valid only when bit [1] is reset.</p> <p>00: Priority ratio is 1:1 01: Priority ratio is 2:1 10: Priority ratio is 3:1 11: Priority ratio is 4:1</p>
16	FB	R/W	<p>Fixed Burst</p> <p>This bit controls whether the AHB main interface performs fixed burst transmission. After it is set, at the beginning of normal burst transmission, the AHB interface only uses SINGLE, INCR4, INCR8 or INCR16. When it is reset, the AHB interface uses single and INCR burst transmission operations.</p>
22:17	RPBL	R/W	<p>Receive DMA programmable burst length (Rx DMA PBL)</p> <p>This bit field indicates the maximum number of beats to transmitted in a Rx DMA transaction. This is the maximum value used in a single block read and write.</p> <p>Each time the burst transmission is started on the host bus, Rx DMA will always attempt to follow the burst specified in RPBL. RPBL can be programmed with allowable value 1, 2, 4, 8, 16 and 32. Any other value may result in undefined behaviors.</p> <p>This field is valid only when USP is set to high level.</p>
23	USP	R/W	<p>Use Separate PBL</p> <p>When set to high level, this bit configures Rx DMA using the value configured in bit [22:17] as PBL. The PBL value in bit [13:8] is applicable only to Tx DMA operations.</p>

Field	Name	R/W	Description
			When reset to low level, the PBL value in bit [13:8] is applicable to two kinds of DMA engines.
24	PBLx4	R/W	PBLx4 Mode When set to high level, this bit will multiply the programmed PBL value by four times. Therefore, the DMA will transmit data at a maximum beam number of 4, 8, 16, 32, 64 and 128 according to the PBL value.
25	AAL	R/W	Address-Aligned Beats When this bit is set to high level and the FB bit is equal to 1, the AHB interface will generate all bursts aligned with the LS bit of the start address. If the FB bit is equal to 0, the first burst (the start address of the access data buffer) is misaligned, but the subsequent bursts are aligned to this address.
26	MB	R/W	Mixed Burst When this bit is set to high level and the FB bit is set to low level, the AHB main interface will start all burst INCR with a length of more than 16, and it will recover to a fixed burst with a burst length of 16 or less.
31:27	Reserved		

27.11.2 Transmit poll demand register (ETH_DMATXPD)

Offset address: 0x1004

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TXPD	R/W	Transmit Poll Demand When these bits are written with any value, DMA will read the current descriptor pointed to by the ETH_DMAHTXD register. If the descriptor is not available, the pending state will be transmitted and returned and the bit [2] of the ETH_DMASTS register will be set. If the descriptor is available, continue to transmit.

27.11.3 Receive poll demand register (ETH_DMARXPD)

Offset address: 0x1008

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	RXPD	R/W	Receive Poll Demand When these bits are written with any value, DMA will read the current descriptor pointed to by the ETH_DMAHRXD register. If the descriptor is not available (owned by the host), the pending state will be transmitted and returned and the bit [7] of the ETH_DMASTS register will be set. If the descriptor is available, Rx DMA will return to active state.

27.11.4 Receive descriptor list address register (ETH_DMARXDLADDR)

Offset address: 0x100C

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	RXSTA	R/W	Start of Receive List This field contains the base address of the first descriptor in the receive descriptor list. LSB bits [1:0, 2:0, or 3:0] of 32-bit, 64-bit, or 128-bit bus width is ignored and is regarded as all zero by DMA. Therefore, these LSB bits are read-only.

27.11.5 Transmit descriptor list address register (ETH_DMATXDLADDR)

Offset address: 0x1010

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	TXSTA	R/W	Start of Transmit List This field contains the base address of the first descriptor in the receive descriptor list. LSB bits [1:0, 2:0, or 3:0] of 32-bit, 64-bit, or 128-bit bus width is ignored and is regarded as all zero by DMA. Therefore, these LSB bits are read-only.

27.11.6 State register (ETH_DMASTS)

Offset address: 0x1014

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TXFLG	RC_W1	Transmit Flag Frame transmission has been completed and TXDES1[31] bit in the first descriptor is set to 1.
1	TXSFLG	RC_W1	Transmit Stopped Flag This bit is set when the transmission stops.
2	TXBU	RC_W1	Transmit Buffer Unavailable This bit indicates that the host owns the next descriptor in the transmit list and DMA cannot get it. Transmission pauses. Bit [22:20] explains the state conversion of the transmission process. To resume processing of the transmit descriptor, the host should change the ownership of the descriptor by setting TXDES0 [31], and then issue a transmit poll demand command.
3	TXJTO	RC_W1	Transmit Jabber Timeout This bit indicates that the transmit Jabber timer times out, and the transmission process will be terminated and in the stop state. This will cause Jabber timeout and the TXDES0 [14] flag bit to be set.
4	RXOVF	RC_W1	Receive Overflow This bit indicates that the receive buffer overflows during frame receiving. If part of the frame is transmitted to the application program, the overflow state will be set in RXDES0 [11].
5	TXUNF	RC_W1	Transmit Underflow This bit indicates that the transmit buffer underflows during frame transmission. Transmission is suspended and the underflow error TXDES0 [1] is set.
6	RXFLG	RC_W1	Receive Flag Frame receiving is completed, and the specific frame state information is updated in the descriptor. Receive and keep running.

Field	Name	R/W	Description
7	RXBUR	RC_W1	<p>Receive Buffer Unavailable</p> <p>This bit indicates that the host owns the next descriptor in the receive list and DMA cannot get it. The receiving process is suspended. To resume processing of the receive descriptor, the host should change the ownership of the descriptor and issue a receive poll demand command. If no receive poll demand is issued, the receiving process will be resumed when the next confirmed incoming frame is received. This bit is set only when the current receive descriptor is owned by DMA.</p>
8	RXSFLG	RC_W1	<p>Receive Stopped Flag</p> <p>This bit will be set to 1 when the receiving process enters the stop state.</p>
9	RXWTOFLG	RC_W1	<p>Receive Watchdog Timeout Flag</p> <p>This bit is will be set to 1 when the length of the received frame is greater than 2048 bytes.</p>
10	ETXFLG	RC_W1	<p>Early Transmit Flag</p> <p>The frame to be transmitted has been completely transmitted to the transmit FIFO.</p>
12:11	Reserved		
13	FBERRFLG	RC_W1	<p>Fatal Bus Error Flag</p> <p>This bit indicates that a bus error has occurred, as described in bit [25:23]. When this bit is set, the corresponding DMA engine will disable all its bus access.</p>
14	ERXFLG	RC_W1	<p>Early Receive Flag</p> <p>This bit indicates that DMA fills the first data buffer of the packet. When the software writes 1 to this bit or bit [6] of this register is set, this bit will be cleared.</p>
15	AINTS	RC_W1	<p>Abnormal Interrupt Summary</p> <p>When the corresponding interrupt bit is enabled in ETH_DMAINTEN register, the value of abnormal interrupt summary bit is the logic or operation result of the following bits:</p> <ul style="list-style-type: none"> ETH_DMASTS[1]: Stop in transmission proces ETH_DMASTS[3]: Transmit Jabber timeout ETH_DMASTS[4]: Receive overflow ETH_DMASTS[5]: Transmit underflow ETH_DMASTS[7]: Receive buffer is unavailable ETH_DMASTS[8]: Stop in receiving proces ETH_DMASTS[9]: Receive watchdog timeout ETH_DMASTS[10]: Early transmit interrupt ETH_DMASTS[13]: Fatal bus error <p>Only the unmasked bit affects the abnormal interrupt summary bit. This is a sticky bit and it must be cleared each time the corresponding bit that causes this bit to be set is cleared.</p>
16	NINTS	RC_W1	<p>Normal Interrupt Summary</p> <p>When the corresponding interrupt bit is enabled in ETH_DMAINTEN register, the value of normal interrupt summary bit is the logic or operation result of the following bits:</p> <ul style="list-style-type: none"> ETH_DMASTS[0]: Transmit interrupt

Field	Name	R/W	Description
			<p>ETH_DMASTS[2]: Transmit buffer is unavailable</p> <p>ETH_DMASTS[6]: Receive interrupt</p> <p>ETH_DMASTS[14]: Early receive interrupt</p> <p>Only the unmasked bit affects the normal interrupt summary bit. This is a sticky bit and it must be cleared each time the corresponding bit that causes this bit to be set is cleared.</p>
19:17	RXSTS	R	<p>Receive Process State</p> <p>This field indicates the receive DMA FSM state. This field does not generate any interrupt.</p> <p>000: Stop: Issue the reset or stop receiving command</p> <p>001: Run: get the receive and transmit descriptors</p> <p>010: Reserved</p> <p>011: Run: wait for receiving message</p> <p>100: Pending: the receive descriptor is unavailable</p> <p>101: Run: disable the receive descriptor</p> <p>110: Reserved</p> <p>111: Run: in the progress of transmitting the received packet data from receive buffer to host memory</p>
22:20	TXSTS	R	<p>Transmit Process State</p> <p>This field indicates the transmit DMA FSM state. This field does not generate any interrupt.</p> <p>000: Stop: issue the reset or stop transmission command</p> <p>001: Run: get the transmit descriptor</p> <p>010: Run: waiting state</p> <p>011: Run: read data from host memory buffer and queue the transmit buffer (Tx FIFO)</p> <p>100, 101: Reserved</p> <p>110: Suspended: the transmit descriptor is unavailable or the transmit buffer underflows</p> <p>111: Run: disable the transmit descriptor</p>
25:23	ERRB	R	<p>Error Bits</p> <p>This field indicates the type of error that causes the bus error, such as the error response of the AHB interface. This field is valid only when the bit [13] is set. This field does not generate any interrupt.</p> <p>000: An error occurs in transmission process of Rx DMA write data</p> <p>011: An error occurs in transmission process of Tx DMA read data</p> <p>100: An error occurs in Rx DMA descriptor write access</p> <p>101: An error occurs in Tx DMA descriptor write access</p> <p>110: An error occurs in Rx DMA descriptor read access</p> <p>111: An error occurs in Tx DMA descriptor read access</p>
26	Reserved		
27	MMCFLG	R	<p>MMC Flag</p> <p>This bit reflects an interrupt event in the MMC module of MAC. The software must read the corresponding register in the MAC to obtain the exact cause of the interrupt, and clear the interrupt</p>

Field	Name	R/W	Description
			source to clear this bit to 0. When this bit is high, an interrupt will be generated after it is enabled.
28	PMTFLG	R	PMT Flag This bit indicates an interrupt event in the PMT module of MAC. The software must read the PMT control and state register in the MAC to obtain the exact cause of the interrupt and clear its source to clear this bit to 0. When this bit is high, an interrupt will be generated after it is enabled.
29	TSTFLG	R	Timestamp Trigger Flag This bit indicates an interrupt event in the timestamp generator block of the MAC. The software must read the corresponding register in the MAC to obtain the exact cause of the interrupt, and clear its source to clear the bit to 0. When this bit is high, an interrupt will be generated after it is enabled.
31:30	Reserved		

27.11.7 Operation mode register (ETH_DMAOPMOD)

Offset address: 0x1018

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	Reserved		
1	STRX	R/W	Start or Stop Receive When this bit is set, the receiving process will be in running state. DMA attempts to obtain the descriptor from the receive list and process the incoming frames. Try to obtain the descriptor from the current location in the list, and this location is the address set by the ETH_DMARXDLADDR register, or the location reserved when stopping before the receiving process. If DMA does not own this descriptor, receive will be suspended and ETH_DMASTS[7] will be set. The "Start receiving" command is valid only after receiving stops. If the command is issued before the ETH_DMARXDLADDR register is set, DMA behavior is unpredictable. When this bit is cleared, Rx DMA operation will stop after transmission of the current frame. The location of next descriptor in the receive list will be saved and become the current location after restarting the receiving process. The stop receiving command is valid only when the receiving process is in "running" or "suspended" state.
2	OSECF	R/W	Operate on Second Frame When this bit is set, it indicates that DMA is processing the second frame of transmitted data, even before obtaining the state of the first frame.
4:3	RXTHCTRL	R/W	Receive Threshold Control These two bits control the threshold level of the receive FIFO. When transmitting to the DMA starts, the frame size of receive FIFO is greater than the threshold. In addition, the complete frame with the length less than the threshold will be transmitted automatically. When the configured "receive FIFO size" is 128 bytes, 11 will not be used. These bits are valid only when the RXSF bit is 0 and will be ignored when the RXSF bit is 1

Field	Name	R/W	Description
			00: 64 01: 32 10: 96 11: 128
5	Reserved		
6	FUF	R/W	Forward Undersized Good Frames When it is set, Rx FIFO will forward small frames, including padding bytes and CRC. When it is reset, Rx FIFO will discard all frames less than 64 bytes unless a frame has been transmitted because the receiving threshold is low, such as RTC=01.
7	FERRF	R/W	Forward Error Frames When this bit is reset, Rx FIFO will discard the frames with error state. However, if the start byte pointer of the frame has been transferred to the read controller end (in threshold mode), the frame will not be discarded. If the start byte of the frame is not transmitted (output) on the ARI bus, Rx FIFO will discard the error frame.
12:8	Reserved		
13	STTX	R/W	Start or Stop Transmission Command When this bit is set, the transmission will be put in the running state, and DMA will check the transmit list of the current location to obtain the frame to be transmitted. The descriptor tries to obtain from the current location in the list or from the previous location reserved when the transmission stops. If the DMA does not own the current descriptor, the transmission will enter the suspended state and the ETH_DMASTS[2] will be set. This command will take effect only when the transmission stops. If the command is issued before the ETH_DMATXDLADDR register is set, DMA behavior is unpredictable. When this bit is reset, the transmission process will stop after transmission of the current frame is completed. The location of next descriptor in the transmit list will be saved and when transmission is restarted, it will become the current location. The stop transmission command is valid only when transmission of the current frame is completed or the transmission is in the "suspended" state.
16:14	TXTHCTRL	R/W	Transmit Threshold Control These bits control the threshold level of the transmit FIFO. At the beginning of transmission, the frame size in the transmit FIFO is greater than the threshold. In addition, the complete frame with the length less than the threshold will also be transmitted. These bits are used only when the bit [21] is reset. 000: 64 001: 128 010: 192 011: 256 100: 40 101: 32 110: 24 111: 16
19:17	Reserved		

Field	Name	R/W	Description
20	FTXF	R/W	Flush Transmit FIFO When this bit is set, the transmit FIFO controller logic will be reset to its default value, so all data in Tx FIFO will be lost or refreshed. This bit will be cleared internally when the refresh operation is completed. Before this bit is cleared, it should not be written into the operation mode register.
21	TXSF	R/W	Transmit Store and Forward When this bit is set, transmission will start if there is a complete frame in the transmit FIFO. When this bit is set, the TTC value specified in bit [16:14] will be ignored. This bit can be replaced only when transmission stops.
23:22	Reserved		
24	DISFRXF	R/W	Disable Flushing of Received Frames When this bit is set, Rx DMA will not refresh any frames because the receive descriptor or buffer is not available as it normally does when this bit is reset.
25	RXSF	R/W	Receive Store and Forward When this bit is set, the frame can be read after a complete frame is written to Rx FIFO, and the RTC bit will be ignored. When this bit is reset, Rx FIFO will run in pass-through mode, limited by the threshold specified by the RTC bit.
26	DISDT	R/W	Disable Dropping of TCP/IP Checksum Error Frames When this bit is set, the MAC will not discard the error frames detected only by the receive checksum offload engine. Such a frame has no error in the Ethernet frame received by the MAC, and only has errors in the encapsulated load. When this bit is reset, if the FERRF bit is reset, all error frames will be discarded.
31:27	Reserved		

27.11.8 Interrupt enable register (ETH_DMAINTEN)

Offset address: 0x101C

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	TXIEN	R/W	Transmit Interrupt Enable When this bit is set to 1 through bit [16], the transmit interrupt will be enabled. When this bit is reset, the transmit interrupt will be disabled.
1	TXSEN	R/W	Transmit Stopped Enable When this bit is set to 1 through bit [15], the transmit stop interrupt will be enabled. When this bit is reset, the transmit stop interrupt will be disabled
2	TXBUEN	R/W	Transmit Buffer Unavailable Enable When this bit is set to 1 through bit [16], the transmit buffer unavailable interrupt will be enabled. When this bit is reset, the transmit buffer unavailable interrupt will be disabled.
3	TXJTOEN	R/W	Transmit Jabber Timeout Enable When this bit is set to 1 through bit [15], the transmit Jabber timeout interrupt will be enabled. When this bit is reset, the transmit Jabber timeout interrupt will be disabled.

Field	Name	R/W	Description
4	RXOVFEN	R/W	Receive Overflow Interrupt Enable When this bit is set to 1 through bit [15], the receive overflow interrupt will be enabled. When this bit is reset, the overflow interrupt will be disabled.
5	TXUNFEN	R/W	Transmit Underflow Interrupt Enable When this bit is set to 1 through bit [15], the transmit underflow interrupt will be enabled. When this bit is reset, the underflow interrupt will be disabled.
6	RXIEN	R/W	Receive Interrupt Enable When this bit is set to 1 through bit [16], the receive interrupt will be enabled. When this bit is reset, the receive interrupt will be disabled.
7	RXBUEN	R/W	Receive Buffer Unavailable Enable When this bit is set to 1 through bit [15], the receive buffer unavailable interrupt will be enabled. When this bit is reset, the receive buffer unavailable interrupt will be disabled.
8	RXSEN	R/W	Receive Stopped Enable When this bit is set to 1 through bit [15], the receive stop interrupt will be enabled. When this bit is reset, the receive stop interrupt will be disabled.
9	RXWTOEN	R/W	Receive Watchdog Timeout Enable When this bit is set to 1 through bit [15], the receive watchdog timeout interrupt will be enabled. When this bit is reset, the receive watchdog timeout interrupt will be disabled.
10	ETXIEN	R/W	Early Transmit Interrupt Enable When this bit is set to 1 through bit [15], the early transmit interrupt will be enabled. When this bit is reset, the early transmit interrupt will be disabled.
12:11	Reserved		
13	FBERREN	R/W	Fatal Bus Error Enable When this bit is set to 1 through bit [15], the fatal bus error interrupt will be enabled. When this bit is reset, the fatal bus error interrupt will be disabled.
14	ERXIEN	R/W	Early Receive Interrupt Enable When this bit is set to 1 through bit [16], the early receive interrupt will be enabled. When this bit is reset, the early receive interrupt will be disabled.
15	AINTSEN	R/W	Abnormal Interrupt Summary Enable When this bit is set, the abnormal interrupt summary will be enabled. When this bit is reset, the abnormal interrupt summary will be disabled. This bit can enable the following interrupts: ETH_DMASTS[1]: Stop in transmission proces ETH_DMASTS[3]: Transmit Jabber timeout ETH_DMASTS[4]: Receive overflow ETH_DMASTS[5]: Transmit underflow ETH_DMASTS[7]: Receive buffer is unavailable ETH_DMASTS[8]: Stop in receiving proces ETH_DMASTS[9]: Receive watchdog timeout ETH_DMASTS[10]: Early transmit interrupt

Field	Name	R/W	Description
			ETH_DMASTS[13]: Fatal bus error
16	NINTSEN	R/W	Normal Interrupt Summary Enable When this bit is set, the normal interrupt summary will be enabled. When this bit is reset, the normal interrupt summary will be disabled. This bit can enable the following interrupts: ETH_DMASTS[0]: Transmit interrupt ETH_DMASTS[2]: Transmit buffer is unavailable ETH_DMASTS[6]: Receive interrupt ETH_DMASTS[14]: Early receive interrupt
31:17	Reserved		

27.11.9 Missed frame and buffer overflow counter register (ETH_DMAMFABOcnt)

Offset address: 0x1020

Reset value: 0x0000 0000

Field	Name	R/W	Description
15:0	MISFCNT	RC_R	Controller Missed Frame Counter It indicates the number of frames lost by the controller because the host receive buffer is not available. This counter will increase each time the DMA discards an incoming frame.
16	MISFCNTOVF	RC_R	Overflow Bit for Missed Frame Counter
27:17	AMISFCNT	RC_R	Application Missed Frame Counter It indicates the number of frames lost by application program.
28	OVFCNTOVF	RC_R	Overflow Bit for FIFO Overflow Counter
31:29	Reserved		

27.11.10 Receive flag watchdog timer register (ETH_DMARXFLGWDT)

Offset address: 0x1024

Reset value: 0x0000 0000

Field	Name	R/W	Description
7:0	RXWDTCNT	R/W	RXFLG Watchdog Timer Count This bit indicates the number of system clock cycles for setting the watchdog timer is multiplied by 256. The watchdog timer is triggered by the value set by the program after Rx DMA completes the transmission of a frame in which the RXFLG state bit is not set, because of the setting in the corresponding descriptor RXDES1[31]. After the watchdog timer times out, set the RXFLG bit to stop the timer. Because RXFLG automatically sets RXDES1[31] of the received frame, the RXFLG bit is set to high level, and the watchdog timer is reset.
31:8	Reserved		

27.11.11 Current host transmit descriptor register (ETH_DMAHTXD)

Offset address: 0x1048

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	HTXDADDRP	R	Host Transmit Descriptor Address Pointer Pointer updated by DMA during operation.

27.11.12 Current host receive descriptor register (ETH_DMAHRXD)

Offset address: 0x104C

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	HRXDADDRP	R	Host Receive Descriptor Address Pointer Pointer updated by DMA during operation.

27.11.13 Current host transmit buffer address register (ETH_DMAHTXBADDR)

Offset address: 0x1050

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	HTXBADDRP	R	Host Transmit Buffer Address Pointer Pointer updated by DMA during operation.

27.11.14 Current host receive buffer address register (ETH_DMAHRXBADDR)

Offset address: 0x1054

Reset value: 0x0000 0000

Field	Name	R/W	Description
31:0	HRXBADDRP	R	Host Receive Buffer Address Pointer Pointer updated by DMA during operation.

28.2 Introduction

The series product has 3 ADC with 12-bit precision. Each ADC has up to 16 external channels and 3 internal channels, and the A/D conversion modes of each channel include single, continuous, scan or discontinuous. ADC conversion results can be left-aligned or right-aligned and stored in 16-bit data register.

28.3 Main characteristics

- (1) ADC power supply requirements: From 2.4V to 3.6V during full-speed operation; 1.8V during low-speed operation.
- (2) ADC input range: $V_{REF-} \leq V_{IN} \leq V_{REF+}$.
- (3) 12-bit, 10-bit, 8-bit or 6-bit resolutions are configurable.
- (4) ADC conversion time
 - Formula: $T_{CONV} = \text{sampling time} + 12 \text{ cycles}$
 - The sampling time is controlled by $SMPCYCCFGx[2:0]$, the minimum sample cycle is 3, and when $ADCCLK = 30\text{MHz}$, the sample time is 3 cycles: $T_{CONV} = 3 \text{ cycles} + 12 \text{ cycles} = 15 \text{ cycles} = 0.5\mu\text{s}$.

- (5) Mode input channel category
 - External GPIO input channel
 - One internal temperature sensor (V_{SENSE}) input channel
 - One internal reference voltage (V_{REFINT}) input channel
 - One internal backup voltage (V_{BAT}) input channel
- (6) Channel conversion mode
 - Single channel conversion mode: single conversion mode, continuous conversion mode
 - Input channel classification: regular channel, injected channel
 - One-group channel conversion mode: scan mode, discontinuous mode and injected channel management
 - ADC mode: Independent ADC mode, and dual/triple ADC mode
- (7) Trigger mode
 - On-chip timer signal trigger
 - External pin
- (8) Data register
 - Regular data register
 - Injected data register
 - General regular data register
- (9) Interrupt
 - End of conversion interrupt
 - Analog watchdog interrupt
 - Overflow interrupt
- (10) DMA request supporting regular data conversion
- (11) Data alignment
 - Configurable data alignment of DALIGNCFG bit of data register
ADC_CTRL2 is left or right alignment.

28.4 Functional description

28.4.1 ADC pins

Table 152 ADC Pins

Name	Description	Signal type
V_{REF+}	High-end/Positive electrode reference voltage used by ADC, $1.8V \leq V_{REF+} \leq V_{DDA}$	Input, analog reference positive electrode

Name	Description	Signal type
V _{DDA}	Equivalent to analog power supply of V _{DD} and: 2.4V ≤ V _{DDA} ≤ V _{DD} (3.6V) during full-speed operation, 1.8V ≤ V _{DDA} ≤ V _{DD} (3.6V) during low-speed operation	Input, analog power supply
V _{REF-}	Low-end/Negative reference voltage used by ADC, V _{REF-} = V _{SSA}	Input, analog reference negative electrode
V _{SSA}	Equivalent to analog power supply of V _{SS}	Input, analog power ground
ADCx_IN[15:0]	16 analog input channels	Analog input signal

28.4.2 ADC conversion mode

The product has multiple built-in ADC and channels (refer to the data manual for the specific number), which can be combined into a variety of conversion modes.

Multiple built-in ADC; according to the number of ADC, the conversion mode can be classified into independent ADC mode and dual ADC mode; multiple built-in channels, which can be classified into two groups, namely regular channel and injected channel. The internal conversion mode of each group can be divided into scan mode and discontinuous mode; for the internal channels of each group, the conversion mode is divided into single conversion mode and continuous conversion mode.

In the application, according to the actual application requirements, the number of ADC, the number of conversion channels and the conversion mode of each channel, the ADC conversion mode meeting the requirements can be designed.

28.4.2.1 Conversion mode of single ADC and single channel

Single ADC channel

Single ADC and single channel are not enabled by external trigger software. The conversion mode is single and continuous concurrent disabling of scan. The result of data conversion is right alignment. After the single ADC conversion is completed, the interrupt is triggered, and data is read in the interrupt service function, not using DMA transmission.

Single conversion mode

In this mode, for single channel, only one conversion is performed for this channel, and for multiple channels, only one conversion is performed for this group of channels .

This mode is started by the ADCEN bit of configuration register ADC_CTRL2 or is started by external trigger.

After one conversion of regular channel is over, the converted data will be stored in 16-bit ADC_REGDATA register, and EOCFLG bit will be set to 1. If configuration EOCIEN bit is set to 1, an interrupt will be generated.

After one conversion of injected channel is over, the converted data will be stored in 16-bit ADC_INJDATA1 register, and INJEOCFLG bit will be set to 1. If configuration INJEOCIEN bit is set to 1, an interrupt will be generated.

Figure 119 Single Conversion Mode Timing Diagram

Continuous conversion mode

In this mode, for single channel, continuous conversion is conducted for this channel.

This mode is started by the ADCEN bit of configuration register ADC_CTRL2 or is started by external trigger.

After the conversion of one regular channel is over, the converted data will be stored in 16-bit ADC_REGDATA register, and EOCFLG bit will be set to 1. If configuration EOCIEN bit is set to 1, an interrupt will be generated.

After the conversion of one injected channel is over, the converted data will be stored in 16-bit ADC_INJDATA1 register, and INJEOCFLG bit will be set to 1. If configuration INJEOCIEN bit is set to 1, an interrupt will be generated.

Figure 120 Continuous Conversion Mode Timing Diagram

28.4.2.2 Conversion mode of single ADC and one group of channels

Single ADC and multiple channels

Enable the scan mode under single-ADC multi-channel condition, the conversion is triggered by software rather than externally, the result of data conversion is right aligned, and the data of ADC conversion results are transmitted to the memory by DMA.

Classification of analog input channels

Regular channel group

- The regular group consists of 16 channels
- Regular channel conversion sequence is determined by the register ADC_REGSEQx
- The total number of conversion channels of regular group is determined by REGSEQLEN bit of configuration register ADC_REGSEQ1

Injected channel group

- The injected group consists of 4 channels
- Injected channel conversion sequence is determined by the register ADC_INJSEQ
- The total number of conversion channels of injected group is determined by INJSEQLEN bit of configuration register ADC_INJSEQ

Internal input channel

Temperature sensor:

- The temperature sensor is used to measure the internal temperature of the chip
- The temperature sensor selects ADC1_IN16 input channel
- Start through TSVREFEN bit of the configuration register ADC_CCTRL
- Select sampling time

The temperature sensor is used to measure the contact temperature of the product. The sensor transmits the voltage value by ADC_IN16 to ADC, and then the voltage value will be converted to a value by ADC.

Configuration

- Enable ADC, select input channel
- Select sampling time (recommend 17.1us)
- Temperature sensor can be enabled by configuring the TSVREFEN bit in the ADC_CCTRL register

- Start conversion by configuring the ADCEN bit in the ADC_CTRL2 register
- The conversion result can be read by accessed the ADC_INJDATA register or ADC_REGDATA register
- Convert the result to temperature T though the formula as:

$$T(^{\circ}\text{C}) = 25 + \frac{V_{25} - V_{sensor}}{Slope}$$

Note:

- (1) V25: The value of V_{sensor} at 25°C, see the Datasheet for more details.
- (2) Slope: Average slope value of V_{sensor} and temperature (Unit: mV/°C), see the Datasheet for more details.
- (3) When configuring the start up time, the ADCEN bit and TSVREFEN bit need to be configured at the same time.

Internal reference voltage V_{REFINT}:

- The internal reference voltage is used to provide a stable voltage output for ADC
- Internal reference voltage V_{REFINT} is used to select ADC1_IN17 input channel

Internal backup voltage V_{BAT}:

- Internal backup voltage V_{BAT} is used to select ADC1_IN18 input channel
- The V_{BAT} pin is internally connected to a bridge divider to ensure that the V_{BAT} is not higher than V_{DDA}, enabling ADC to operate normally

Channel conversion sequence

Configuration of regular sequence registers:

- Configure REGSEQC1~REGSEQC6 bits of the register ADC_REGSEQ3 to set No. 1~6 conversion channels
- Configure REGSEQC7~REGSEQC12 bits of the register ADC_REGSEQ2 to set No. 7~12 conversion channels
- Configure REGSEQC13~REGSEQC16 bits of the register ADC_REGSEQ1 to set No. 13~16 conversion channels
- Configure REGSEQLEN of the register ADC_REGSEQ1 to set the number of channels for conversion

Configuration of injected sequence register:

- Configure INJSEQC1~INJSEQC4 bit of the register ADC_INJSEQ to set No. 1~4 conversion channels

- Configure INJSEQLEN of the register ADC_INJSEQ to set the number of channels for conversion
- If the value of INJSEQLEN is less than 4, the conversion sequence will be different and start from (4-INJSEQLEN).

Channel conversion mode

Scan Mode

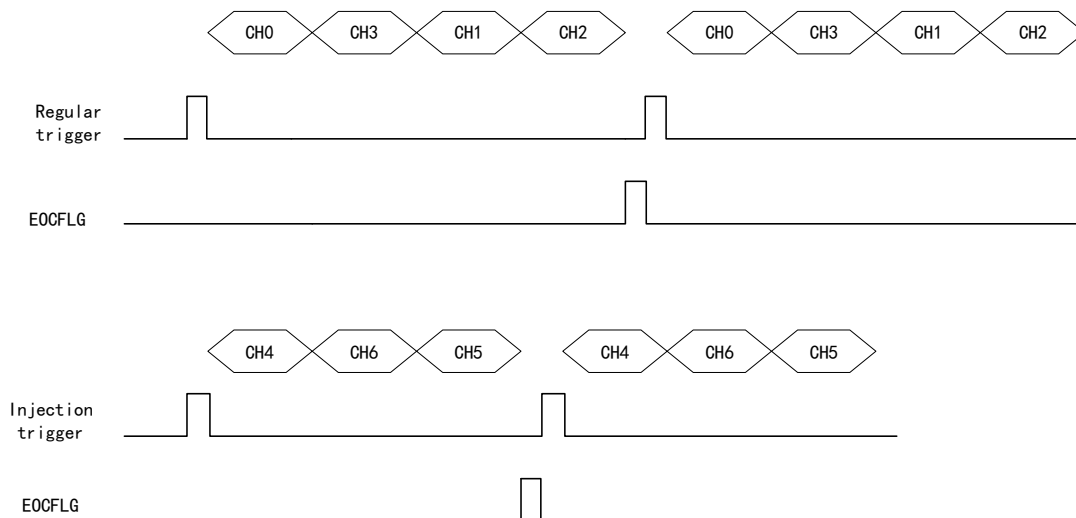

This mode is applicable to one group of channels, which is equivalent to a single conversion on each channel of one group of channels.

This mode is started by SCANEN bit of configuration register ADC_CTRL1, and after startup, ADC scans all channels which are arranged according to the sequence register ADC_REGSEQ or the ADC_INJSEQ, and after each channel conversion is completed, it will be automatically converted to the next channel of the group.

If the configuration CONTCEN bit is set to 1, the conversion will continue from the first channel of the group when the last channel of the group completes conversion.

If the configuration DMAEN bit is set to 1, the DMA controller will transmit the converted data of regular channel to SRAM every time the channel conversion is completed.

Figure 121 Scan Mode Timing Diagram

Discontinuous mode

This mode is suitable for a group of channels, which is equivalent to continuous conversion of multiple channels in a group of channels.

For regular groups, this mode is started by REGDISCEN bit of configuration register ADC_CTRL1; after startup, conduct short sequence conversion of n

channels ($n \leq 8$), and n is determined by DISCNUMCFG[2:0] of configuration register ADC_CTRL1; next round of conversion of n channels can be started through software control or external trigger source and when the conversion of all channels of this group is completed, EOCFLG bit will be set to 1.

For injected groups, this mode is enabled by INJDISCEN bit of configuration register ADC_CTRL1; after startup, one channel will be converted according to the configuration sequence of the sequence register; conversion of next channels can be started by software control or external trigger source and when the conversion of all channels of this group is completed, EOCFLG bit and INJEOCFLG bit will be set to 1.

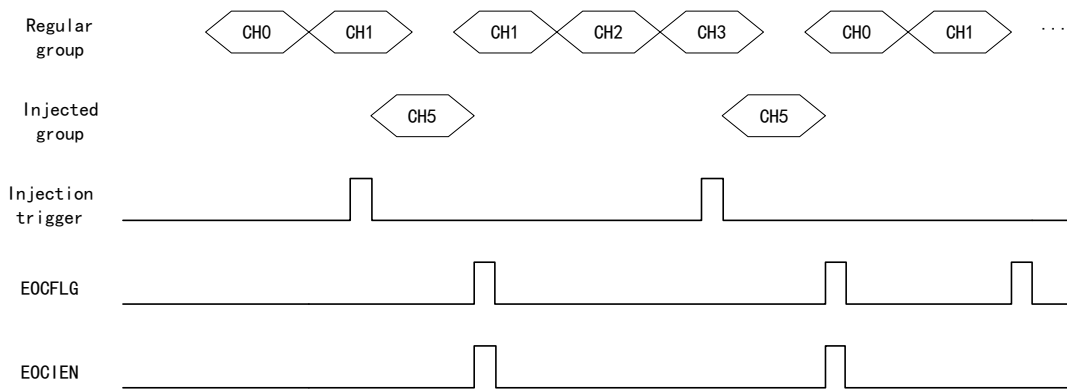

Figure 122 Discontinuous Mode Timing Diagram

Injected channel management

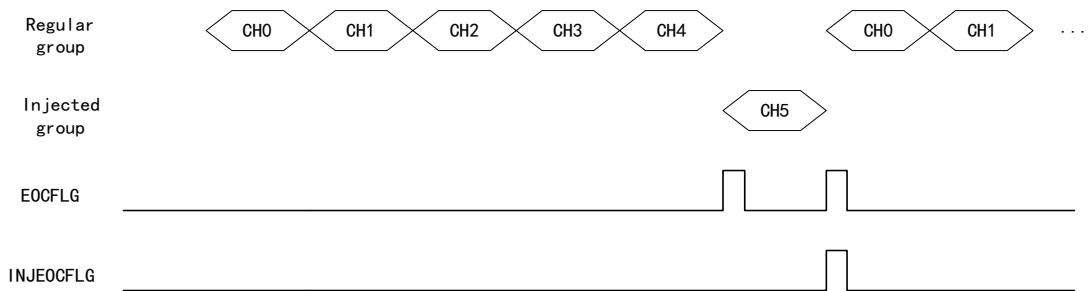

Trigger injection: Start by clearing INJGACEN bit of the register ADC_CTRL1 and configuring the SCANEN bit. If a software trigger or external trigger is generated during the conversion of regular group channels, the injected conversion will be triggered. At this time, the regular channel conversion will stop, the injected channel sequence will start conversion, and after the injected group channel conversion is completed, the regular group channel conversion will be recovered.

Figure 123 Trigger Injection Timing Diagram

Automatic injection: Start by INJGACEN bit of configuration register ADC_CTRL1; after conversion of the regular group channels is completed, the injected group channels will start conversion automatically; in the automatic injection mode, external trigger of the injected group channels must be disabled; if the CONTCEN bit of the register ADC_CTRL2 is also configured, all channels of regular group and injection group will convert continuously.

Figure 124 Automatic Injection Timing Diagram

28.4.2.3 Dual or triple ADC mode and conversion mode of one group of channels

For products with two or more ADC modules, dual or triple ADC mode is used. ADC1 is the master ADC by default, while others are the slave ADC by default, and the ADC mode is set by configuring ADCMSEL bit in ADC1_CCTRL register.

When the configuration is triggered by external event, it is required to set it to trigger only the master ADC, and then configure the slave ADC to be triggered by software. (External trigger of master and slave must occur at the same time)

There are six possible dual or triple ADC modes:

(1) Simultaneous regular mode

The simultaneous regular mode means multiple ADC convert a regular channel group at the same time. Two ADC cannot convert one channel at the same time. The external trigger event is determined by REGEXTTRGSEL of the register ADC1_CTRL2.

EOCFLG interrupt will be generated after all ADC regular channels are converted. Dual ADC mode: After conversion is over, a DMA transmission request will be generated, and the ADC1 converted data are stored in low 16 bits of the register ADC1_REGDATA, while the ADC2 converted data are stored in high 16 bits of the register ADC_REGDATA. Triple ADC mode: After conversion is over, three DMA requests will be generated to transmit ADC1, ADC2 and ADC3 converted data to the memory.

(2) **Simultaneous injection mode**

The simultaneous injection mode means multiple ADC convert an injected channel group at the same time. Two ADC cannot convert one channel at the same time. The external trigger event is determined by INJGEXTTRGSEL of the register ADC1_CTRL2.

After ADC conversion is over, the converted data will be stored in the register ADC_INJDATAx of each ADC interface.

INJEOCFLG interrupt will be generated after all ADC injected channels are converted.

(3) **Alternate mode**

The alternate mode means multiple ADC convert a regular channel group alternately. The external trigger event is determined by REGEXTTRGSEL of the register ADC1_CTRL2.

Dual ADC mode: After triggering, ADC1 starts first, ADC2 starts after delay, and the delay is configured through SMPDEL2 bit of the register ADC_CCTRL. After the conversion is completed, an EOCFLG interrupt will be generated, and then a DMA request will be generated, and the data will be transmitted in DMA mode 2. Triple ADC mode: After triggering, ADC1 starts first, ADC2 starts after delay, ADC3 starts after delay of ADC2 conversion, and the delay is configured through SMPDEL2 bit of register ADC_CCTRL. Every two conversions are made, a DMA request will be generated and the data will be transmitted in DMA mode 2.

(4) **Alternate trigger mode**

The alternate trigger mode means multiple ADC trigger and convert an injected channel group alternately. The external trigger event is determined by INJGEXTTRGSEL of the register ADC1_CTRL2.

Dual ADC mode: When the first trigger is generated, convert all channels of injection group in ADC1, and when the second trigger is generated, convert all channels of injection group in ADC2, and after each ADC completes conversion, generate an INJEOCFLG interruption. Triple ADC mode: When the first trigger is generated, convert all channels of injection group in ADC1, and when the second trigger is generated, convert all channels of injection group in ADC2,

and when the third trigger is generated, convert all channels of injection group in ADC3, and after each ADC completes conversion, generate an INJEOCFLG interrupt.

(5) Mixed simultaneous regular/injection mode

The mixed simultaneous regular/injection mode means after the simultaneous regular mode is interrupted, the simultaneous injection mode will be enabled.

In this mode, a sequence of the same length must be converted or a trigger interval time must be set to complete the conversion of a longer sequence.

(6) Mixed simultaneous regular + alternate trigger mode

The mixed simultaneous regular + alternate trigger mode means after the simultaneous regular mode is interrupted, the alternate trigger mode will be enabled.

In this mode, a sequence of the same length must be converted or a trigger interval time must be set to complete the conversion of a longer sequence.

28.4.3 External trigger

Register configuration of external trigger is as follows:

- The external event trigger of regular group channel is enabled by REGEXTTRGSEL bit of configuration register ADC_CTRL2
- The external event trigger of injected group channel is started by INJGEXTTRGSEL bit of configuration register ADC_CTRL2.

Table 153 External Trigger of Regular Channel

Trigger source	REGEXTTRGSEL[3:0]	Trigger type

28.4.4 Data register

28.4.4.1 Regular data register

ADC_REGDATA is a 32-bit ADC regular data register. In single-ADC mode, only the lower 16 bits are used to store the converted data. In dual-ADC mode, the lower 16 bits are used to store the converted data of ADC1 while the higher 16 bits are used to store the converted data of ADC2. The data are left aligned or right aligned.

It is determined by DALIGNCFG bit of configuration register ADC_CTRL2 whether to use DMA transmission. There are at most 16 regular channels, but only one regular data register. Therefore, data coverage will occur in multi-channel conversion, and DMA transmission is needed at this time.

28.4.4.2 Injection data memory

ADC_INJDATA_x (x=1,2,3,4) is ADC injected data register, and there are four 32-bit registers, of which the low 16 bits are effective and the high 16 bits are reserved. There are at most four injected channels and four injection data registers, so data coverage will not occur in multi-channel conversion. The data are left aligned or right aligned.

28.4.4.3 General regular data memory

ADC_CDATA is a general regular data register of ADC, and is only applicable to dual or triple mode. DMA is generally required to cooperate with data transmission in dual or triple mode.

28.4.5 Interrupt

28.4.5.1 End of conversion interrupt

Interrupt of end of conversion of regular group channels

An interrupt will be generated by the end of conversion of regular channels; read the value of the regular data register in the interrupt function.

Determine by EOCFLG bit of configuration register ADC_STS.

Interrupt of end of conversion of injected group channels

An interrupt will be generated after the conversion of injected channels is completed; read the value of the regular data register in the interrupt function.

Determine by INJEOCFLG bit of configuration register ADC_STS.

28.4.5.2 Analog watchdog interrupt

If the input analog voltage is not within the threshold range, an analog watchdog interrupt will be generated.

Determine by configuring AWDFLG bit of the register ADC_STS.

28.4.5.3 Overflow interrupt

When the conversion data is lost (overflow), an overflow interrupt will be generated.

Determine by OVRFLG bit of configuration register ADC_STS.

28.4.6 DMA

DMA request will be generated after the conversion of regular channels is completed; the converted data result can be transmitted to the memory from the ADC_REGDATA register.

28.5 Register address mapping

Table 155 ADC Register Address Mapping

Register name	Description	Offset address
ADC_STS	ADC state register	0x00
ADC_CTRL1	ADC control register 1	0x04
ADC_CTRL2	ADC control register 2	0x08
ADC_SMPTIM1	ADC sampling time register 1	0x0C
ADC_SMPTIM2	ADC sampling time register 2	0x10
ADC_INJDOFx	ADC injected channel data offset register x	0x14-0x20
ADC_AWDHT	Analog watchdog high-threshold register	0x24
ADC_AWDLT	Analog watchdog low-threshold register	0x28
ADC_REGSEQ1	ADC regular sequence register 1	0x2C
ADC_REGSEQ2	ADC regular sequence register 2	0x30
ADC_REGSEQ3	ADC regular sequence register 3	0x34
ADC_INJSEQ	ADC injected sequence register	0x38
ADC_INJDATAx	ADC injected data register X	0x3C-0x48
ADC_REGDATA	ADC regular data register	0x4C
ADC_CSTS	ADC general-purpose state register	0x00
ADC_CCTRL	ADC general-purpose control register	0x04
ADC_CDATA	Applicable to dual and triple mode general rule data registers	0x08

28.6 Register functional description

28.6.1 ADC state register (ADC_STS)

Offset address: 0x00

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	AWDFLG	RC_W0	Analog Watchdog Occur Flag This bit is set to 1 by hardware and cleared by software, indicating whether an analog watchdog event occurs. 0: No occurrence 1: Occurred
1	EOCFLG	RC_W0	Regular Channel End Of Conversion Flag 0: Not completed 1: Completed

Field	Name	R/W	Description

29 Digital-to-analog converter (DAC)

29.1 Full name and abbreviation description of terms

Table 156 Full Name and Abbreviation Description of DAC Terms

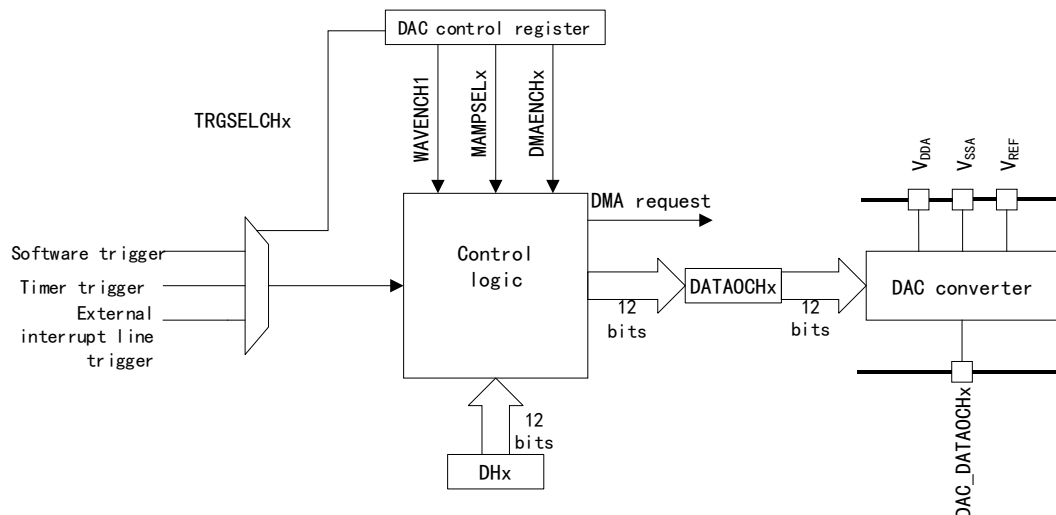

Full name in English	English abbreviation
Linear Feedback Shift Register	LFSR

29.2 Introduction

DAC is a digital/analog converter that can be configured to input 8-bit or 12-bit data and output voltage. When 12-bit data is input, the data can be set to be left aligned or right aligned. It has two-way DAC output channels, which do not affect each other; each channel has multiple trigger sources to trigger conversion; a single channel can trigger conversion output, or both channels can trigger conversion output at the same time. Both channels can generate noise waveform and triangle waveform independently.

29.3 Structure block diagram

Figure 125 DAC Structure Block Diagram

29.4 Functional description

29.4.1 DAC conversion and trigger source

DAC output can obtain corresponding voltage value by calculating the data in DAC_DATAOCHx register. However, it is impossible to write data directly to DAC_DATAOCHx register, and it is required to write to DAC_DHx register and then through corresponding trigger, load the data in DAC_DHx to

DAC_DATAOCHx.

When the channel trigger is disabled (TRGENCHx bit in the register DAC_CTRL is set to 0), write the value in DAC_DHx register and it will be automatically transferred to DAC_DATAOCHx after one APB1 clock cycle.

When the channel trigger is enabled (TRGENCHx bit in the register DAC_CTRL is set to 1), write the value in DAC_DHx register and it will be transferred to DAC_DATAOCHx after different clock cycles according to the selected trigger source. Three types of trigger sources can be selected:

- Timer update event
- External interrupt trigger
- Software trigger

When the update event and external interrupt of the timer are selected as the trigger source, the transmission will be completed after three APB clock cycles; when software trigger is selected, the transmission will be completed after one APB1 clock cycle.

When transmitting the data to DAC_DATAOCHx register, after a period of time, the digital quantity will be outputted after it is converted linearly into analog voltage. The intermediate conversion time will vary according to the power supply voltage and the analog output load.

29.4.2 DAC reference voltage and output

DAC uses V_{REF} as reference voltage and by grounding the V_{SSA} , the output voltage range of DAC can be obtained, namely: $0-V_{REF}$.

DAC output calculation formula is: $DAC\ output = V_{REF} * (DATAOCHx/4095)$.

29.4.3 DAC data format

Single-channel DAC

The registers that are written in three modes are as follows

- 8-bit data right aligned: DAC_DH8Rx[7:0]
- 12-bit data left aligned: DAC_DH12Lx[15:4]
- 12-bit data right aligned: DAC_DH12Rx[11:0]

Double-channel DAC

The registers that are written in three modes are as follows

- 8-bit data right aligned: DAC_DH8RD[15:0]
- 12-bit data left aligned: DAC_DH12LDUAL[15:4],
DAC_DH12LDUAL[31:20]
- 12-bit data right aligned: DAC_DH12RDUAL[11:0],
DAC_DH12RDUAL[27:16]

29.4.4 DAC waveform generation

Each channel of DAC can independently generate noise and triangle wave.

29.4.5 DAC double-channel conversion

When two channels work at the same time, the written data can be written to the common registers: DH8RDUAL, DH12RDUAL and DH12LDUAL, so as to effectively use the bus bandwidth.

Dual-channel conversion can be divided into independent conversion and synchronous conversion. The specific configuration and description are as follows.

29.4.5.1 Independent trigger

Waveform generator disabled

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use different trigger sources.

Use the same LFSR

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use different trigger sources;
- (3) Enable the noise generation function of two channels, and set the same LFSR mask value.

Use different LFSR

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use different trigger sources;
- (3) Enable the noise generation function of two channels, and set different LFSR mask values.

Generate the same triangle wave

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use different trigger sources;
- (3) Enable the triangle wave generation function of two channels, and set the same triangular amplitude.

Generate different triangle wave

- (1) Enable two-channel trigger mode;

- (2) Configure two channels and use different trigger sources;
- (3) Enable the triangle wave generation function of two channels, and set different triangular amplitudes.

29.4.5.2 Synchronous trigger

Synchronous software startup

Disable the trigger mode of two channels; after writing data, wait for one APB1 clock cycle and then transfer to DAC_DATAOCH1 and DAC_DATAOCH2 registers at the same time.

Waveform generator disabled

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use the same trigger source.

Use the same LFSR

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use the same trigger source;
- (3) Enable the noise generation function of two channels, and set the same LFSR mask value.

Use different LFSR

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use the same trigger source;
- (3) Enable the noise generation function of two channels, and set different LFSR mask values.

Generate the same triangle wave

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use the same trigger source;
- (3) Enable the triangle wave generation function of two channels, and set the same triangular amplitude.

Use different triangle wave

- (1) Enable two-channel trigger mode;
- (2) Configure two channels and use the same trigger source;

- (3) Enable the triangle wave generation function of two channels, and set different triangular amplitudes.

30 Random number generator (RNG)

30.1 Introduction

RNG is a random number generator, which provides a 32-bit random number in the master reading based on continuous analog noise.

30.2 Main characteristics

- (1) Provide 32-bit random number generated by the analog generator
- (2) The interval between two consecutive random numbers is 40 PLLCLK48 clock signal cycles
- (3) Monitor RNG entropy to mark abnormal behaviors
- (4) Disabling RNG can reduce the power consumption

30.3 Functional description

The random number generator is realized by analog circuit. This circuit provides seeds for the linear feedback shift register to generate 32-bit random numbers.

Multiple ring oscillators form an analog circuit, and the seeds are generated by XOR operation through the frequency output by the oscillator. PLLCLK48 is dedicated clock of RNG_LFSR, and it provides clock information for it at a constant frequency, so the quality of random numbers has nothing to do with the frequency of HCLK. After RNG_LFSR introduces a large number of seeds, the content will be transferred to RNG_DATA register. Meanwhile, the system will monitor the seeds and PLLCLK48. The status bit in RNG_STS register indicates the time when an abnormal sequence occurs on the seed or the PLLCLK48 clock frequency is too low. An interrupt will be generated when an error is detected.

30.3.1 Enable RNG

The setting sequence of enabling RNG is as follows:

- (1) Enable interrupt and an interrupt will be generated when the random number is ready or an error occurs.
- (2) A random number will be generated when RNG_CTRL[RNGEN]=1. At this time, the analog part, RNG_LFSR and error detector will be activated.
- (3) At the time of each interrupt, when CLKERINT bit and FSINT bit of RNG_STS register are set to 0 and DATARDY=1, RNG_DATA register can be read.

Do not use the first random number generated after RNGEN bit is set, and it should be saved for comparison with the next random number. Each random number needs to be compared with the previous random number. If any pair is equal, it means that the continuous random number generator test fails.

30.3.2 Error state

30.3.2.1 Clock error

When a clock error occurs because the PLLCLK48 clock is incorrect, RNG cannot generate random numbers again. Check whether the clock controller is configured correctly to provide RNG clock and clear CLKERINT bit. RNG can work normally when CLKERCSTS=0. The clock error does not affect the last random number, so the random number in RNG_DATA register can be used.

30.3.2.2 Seed error

In case of a seed error, the interrupt random number will be generated as long as FSCSTS=1. Since the entropy may be insufficient, if there are already data in RNG_DATA register, the generated interrupt random number cannot be used.

RNGEN bit shall be set after FSINT bit is cleared to reinitialize and restart RNG.

30.4 Register address mapping

Table 158 RNG Register Address Mapping

Register name	Description	Offset address

1:0			Reserved
2	RNGEN	R/W	RNG Enable 0: Disable 1: Enable
3	INTEN	R/W	Interrupt Enable 0: Disable 1: Enable; when any of DATARDY bit, CLKERINT bit and FSINT bit in RNG_STS register is set to 1, an interrupt will be pending

Field	Name	R/W	Description
31:4			Reserved

30.5.2 RNG state register (RNG_STS)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	DATARDY	R	Data Ready 0: RNG_ Data register is not ready, and the random data is not available 1: RNG_ Data register is ready, and the random data is available An interrupt will be pending when INTEN=1. After reading RNG_DATA register, this bit will be cleared to zero until a new valid value is figured out.
1	CLKERCSTS	R	RNGCLK Error Current Status 0: PLLCLK48 clock is detected. If CLKERINT bit is set to 1, it means that clock error has been detected and recovered to normal. 1: PLLCLK48 clock is not detected
2	FSCSTS	R	Faulty Sequence Current Status 0: Sequence error is not detected. If FSINT bit is set to 1, it means that faulty sequence has been detected and recovered to normal. 1: More than 64 0/1 or more than 32 alternate 0 and 1 are detected
4:3			Reserved
5	CLKERINT	RC_W0	RNGCLK Error Interrupt Status 0: PLLCLK48 clock is detected 1: PLLCLK48 clock is not detected This bit can be set at the same time with CLKERCSTS bit and be cleared by writing 0. An interrupt will be pending when INTEN=1.
6	FSINT	RC_W0	Faulty Sequence Interrupt Status 0: Faulty sequence is not detected. 1: More than 64 0/1 or more than 32 alternate 0 and 1 are detected This bit can be set at the same time with FSCSTS bit and be cleared by writing 0. An interrupt will be pending when INTEN=1.
31:7			Reserved

30.5.3 RNG data register (RNG_DATA)

Offset address: 0x08

Reset value: 0x0000 0000

This register is read-only and provides 32-bit random number when reading.

This register can be read only when DATARDY bit is set to 1; after reading, this register will provide new random number within 40 PLLCLK48 clock cycles.

Field	Name	R/W	Description
31:0	DATA	R	Random Data 32-bit data number.

31 Cyclic redundancy check computing unit (CRC)

31.1 Introduction

The cyclic redundancy check (CRC) computing unit can get 32-bit CRC computing result by calculating the input data through a fixed generator polynomial, which is mainly used to detect or verify the correctness and integrity of the data after transmission or saving.

31.2 Functional description

31.2.1 Calculation method

Use CRC-32 (Ethernet) polynomial: 0x4C11DB7

$$(X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X+1)$$

31.2.2 Calculation time

The calculation time is four AHB clock cycles.

Every time a new data is written, the result will be a combination of the last calculation result and the new calculation result. (Execute operation for the whole word). Write operation of CPU will be suspended during calculation, so that "Back-to-back" write or continuous "read" -"write" operation can be performed for the register CRC_DATA.

31.3 Register address mapping

Table 159 CRC Register Address Mapping

Register name	Description	Offset address
CRC_DATA	Data register	0x00
CRC_INDATA	Independent data register	0x04
CRC_CTRL	Control register	0x08

31.4 Register functional description

31.4.1 Data register (CRC_DATA)

Offset address: 0x00

Reset value: 0xFFFF FFFF

Field	Name	R/W	Description
31:0	DATA	R/W	32bit Data As the input register: Store the new data of CRC calculator when writing. As the output register: Return the results of CRC computing when reading.

31.4.2 Independent data register (CRC_INDATA)

Offset address: 0x04

Reset value: 0x0000 0000

Field	Name	R/W	Description
7:0	INDATA	R/W	Independent 8bit Data Can be used for temporary storage of 1-byte data. CRC rest generated by RST bit of the register CRC_CTRL has no effect on this register.
31:8	Reserved.		

Note: This register does not take part in calculation and can store any data.

31.4.3 Control register (CRC_CTRL)

Offset address: 0x08

Reset value: 0x0000 0000

Field	Name	R/W	Description
0	RST	W	Reset CRC Calculation Unit Set CRC_DATA register to 0xFFFF FFFF. It can only set this bit, which shall be automatically cleared by hardware.
31:1	Reserved		

32 Chip electronic signature

32.1 Introduction

The chip electronic signature is used to match the firmware or external device.

32.2 Register functional description

32.2.1 96-bit unique chip ID of unique device

Base address: 0x1FFF 7A10

Offset address: 0x00

Field	Name	R/W	Description
31:0	U_ID[31:0]	R	Unique identity flag 31:0 bit

Offset address: 0x04

Read-only, the value has been prepared before leaving the factory

Field	Name	R/W	Description
31:0	U_ID[63:32]	R	Unique identity flag 63:32 bits

Offset address: 0x08

Read-only, the value has been prepared before leaving the factory

Field	Name	R/W	Description
31:0	U_ID[95:64]	R	Unique identity flag 95:64 bits

32.2.2 Flash memory capacity register

Base address: 0x1FFF 7A22

Offset address: 0x00

Field	Name	R/W	Description
15:0	F_SIZE	R	Flash memory capacity Indicate the capacity of main memory area of the product (in KB). For example: 0x0400=1024KB

33 Version History

Table 160 Document Version History

Date	Version	Change History
March, 2023	V1.0	New
November, 2023	V1.1	<ul style="list-style-type: none"> (1) Modify TMRx in TMR1/8_ Reset value of AUTORLD register (2) Modify TMRx in TMR10/11/13/14_ Description of CCM1 [CC1SEL] (3) Modify the TMR1 structure diagram (4) Modify the I/O structure diagram of the GPIO chapter
November 23, 2023	V1.2	<ul style="list-style-type: none"> (1) Modify GPIOx_ OSSEL, GPIOx_ALFL and GPIOx_ALFH Register Field Description

Statement

This document is formulated and published by Geehy Semiconductor Co., Ltd. (hereinafter referred to as “Geehy”). The contents in this document are protected by laws and regulations of trademark, copyright and software copyright. Geehy reserves the right to make corrections and modifications to this document at any time. Please read this document carefully before using Geehy products. Once you use the Geehy product, it means that you (hereinafter referred to as the “users”) have known and accepted all the contents of this document. Users shall use the Geehy product in accordance with relevant laws and regulations and the requirements of this document.

1. Ownership

This document can only be used in connection with the corresponding chip products or software products provided by Geehy. Without the prior permission of Geehy, no unit or individual may copy, transcribe, modify, edit or disseminate all or part of the contents of this document for any reason or in any form.

The “极海” or “Geehy” words or graphics with “®” or “™” in this document are trademarks of Geehy. Other product or service names displayed on Geehy products are the property of their respective owners.

2. No Intellectual Property License

Geehy owns all rights, ownership and intellectual property rights involved in this document.

Geehy shall not be deemed to grant the license or right of any intellectual property to users explicitly or implicitly due to the sale or distribution of Geehy products or this document.

If any third party’s products, services or intellectual property are involved in this document, it shall not be deemed that Geehy authorizes users to use the aforesaid third party’s products, services or intellectual property, unless otherwise agreed in sales order or sales contract.

3. Version Update

Users can obtain the latest document of the corresponding models when ordering Geehy products.

If the contents in this document are inconsistent with Geehy products, the agreement in the sales order or the sales contract shall prevail.

4. Information Reliability

The relevant data in this document are obtained from batch test by Geehy Laboratory or cooperative third-party testing organization. However, clerical errors in correction or errors caused by differences in testing environment may occur inevitably. Therefore, users should understand that Geehy does not bear any responsibility for such errors that may occur in this document. The relevant data in this document are only used to guide users as performance parameter reference and do not constitute Geehy's guarantee for any product performance.

Users shall select appropriate Geehy products according to their own needs, and effectively verify and test the applicability of Geehy products to confirm that Geehy products meet their own needs, corresponding standards, safety or other reliability requirements. If losses are caused to users due to the user's failure to fully verify and test Geehy products, Geehy will not bear any responsibility.

5. Legality

USERS SHALL ABIDE BY ALL APPLICABLE LOCAL LAWS AND REGULATIONS WHEN USING THIS DOCUMENT AND THE MATCHING GEEHY PRODUCTS. USERS SHALL UNDERSTAND THAT THE PRODUCTS MAY BE RESTRICTED BY THE EXPORT, RE-EXPORT OR OTHER LAWS OF THE COUNTRIES OF THE PRODUCTS SUPPLIERS, GEEHY, GEEHY DISTRIBUTORS AND USERS. USERS (ON BEHALF OR ITSELF, SUBSIDIARIES AND AFFILIATED ENTERPRISES) SHALL AGREE AND PROMISE TO ABIDE BY ALL APPLICABLE LAWS AND REGULATIONS ON THE EXPORT AND RE-EXPORT OF GEEHY PRODUCTS AND/OR TECHNOLOGIES AND DIRECT PRODUCTS.

6. Disclaimer of Warranty

THIS DOCUMENT IS PROVIDED BY GEEHY "AS IS" AND THERE IS NO WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, TO THE EXTENT PERMITTED BY APPLICABLE LAW.

GEEHY WILL BEAR NO RESPONSIBILITY FOR ANY DISPUTES ARISING FROM THE SUBSEQUENT DESIGN OR USE BY USERS.

7. Limitation of Liability

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL GEEHY OR ANY OTHER PARTY WHO PROVIDE THE DOCUMENT "AS IS", BE LIABLE FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, DIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE DOCUMENT (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY USERS OR THIRD PARTIES).

8. Scope of Application

The information in this document replaces the information provided in all previous versions of the document.
